and twenty-fifth army corps, with the first cavalry division; Kasan military district, sixteenth and twenty-fourth army corps, with the fifth cavalry division.

Before the outbreak of the war the Russian army numbered about 1,700,000 trained soldiers, with a decrease occurring after April 14, when the fourth class was sent home, reducing the figures to about 1,300,000 men. Under normal conditions the number of recruits would have been increased by 150,000 in 1914, with a similar increase for the ensuing two years. Then the peace effectives would have been brought up to 1,760,000. The time of service for the infantry remained at three years, and that for the other troops was placed at four years. Previous to the outbreak of the war, considering the extent of the frontier, the Russian force was below the armies of Germany and Austria, and on the same basis would have required a peace effective of 3,000,000 men.

NAVY. The number and displacement of war-ships built, of 1500 or more tons, and of torpedo craft of 50 tons and over, were July 1, 1914, as follows: Battleships, dreadnought type (having a main battery of all big guns, 11-inch or more in calibre), none built (7, of 159,509 tons estimated, building); 7 battleships, predreadnought type (of about 10,000 or more tons displacement and with main battery of more than 1 calibre), of 98,750 tons; 2 coast-defense vessels, of 10,380; battle cruisers, none built (4, of 128,000 building); 6 armored cruisers, of 63,500; 9 cruisers, of 62,845 (and 8, of 53,600 tons, building); 91 torpedo-boat destroyers, of 36,748 (and 44, of 53,664 tons, building); 14 torpedo boats, of 2132; 30 submarines, of 6506 (and 19, of 13,284 tons, building)—a total tonnage built of 270,861 and 407,957 building; total tonnage built and building, 678,818. Several powerful ships under construction in 1914 should be in commission by the time the Baltic again becomes navigable. The protected cruisers outside the Black Sea numbered four. The Baltic fleet was commanded at the beginning of the war by Admiral von Essen. The total personnel is about 80,000. Air craft included 6 military dirigibles on hand and 10 ordered, and 250 military aeroplanes on hand, including monoplanes, biplanes, and hydro-aeroplanes.

GOVERNMENT. All executive, legislative, and judicial powers are vested in an autocratic Czar, under the title Emperor of all the Russias. There is a nominal constitution. The council of empire includes an equal number of elected members and members nominated by the Czar. There is a national assembly (Duma) of 442 members. Reigning Czar, Nicholas II, born May 18, 1868, succeeded his father Alexander III, Nov. 1, 1894. In the month of his accession he married Princess Alix of Hesse. The heir-apparent, Alexis, was born Aug. 12, 1904. The ministry in 1914 was composed as follows: J. L. Goremykine, president of the council of ministers; A. A. Maklakov, interior; Gen. W. B. (Count) Fredericksz, minister of the imperial household; S. D. Sazonov, foreign affairs; Gen. W. A. Sukhomlinov, war; Admiral I. K. Grigorievich, marine; J. G. Stecheglovitov, justice; S. I. Timachev, commerce; S. V. Rukhlov, communications; V. K. Sabler, procurator of the Holy Synod; A. V. Krivocheyn, agriculture; P. A. Kharitonov, state comptroller; Dr. L. A.

Casso, instruction; P. L. Bark, finance. President of the council of empire, M. Akimov.

HISTORY

DISRUPTION OF THE OCTOBRIST PARTY. The division of the Octobrist group into three sections, as recorded in the last YEAR BOOK, became more clearly marked in January. Holding the balance of power between the Right and the Left, the Octobrist group occupied a position of exceptional significance. If the Octobrists had remained faithful to the decisions taken at their party congress (November, 1913), they would have inclined to the Left; for the party congress had condemned the government, reaffirmed the manifesto of October 30, and declared that the rejuvenation of Russia must be based on the principles of constitutional government and civil liberty. The Right wing of the party, however, refused to recognize the resolutions of the congress as binding upon the individual members of the party. The 14 members who constituted the extreme Left wing of the group openly seceded. Twenty-two of the moderates formed a third group under the leadership of Rodzyanko, the president of the Duma. When the Duma reassembled on January 27, the Left Octobrists numbered 20; the Centre Octobrists, 67 strong, called themselves the Zemstvo Group; the Right Octobrists remained unorganized.

CABINET CHANGES. On February 12, Prime Minister Kokovtsev was unexpectedly removed from office, receiving the title of count as a reward for his services; the septuagenarian statesman Goremykine was appointed to succeed Kokovtsev as premier; and M. Bark was entrusted with the portfolio of finance, which the ex-premier had also held. M. Goremykine was to labor for the conciliation of the various inharmonious elements in the cabinet. M. Bark was charged with the duty of finding new revenues to take the place of the government brandy monopoly, and "to develop the productive capabilities of the land and the nation." Count Witte, who had borne a conspicuous part in the antialcohol crusade, was placed at the head of a commission to coöperate with the government in the reorganization of the financial system; for a very considerable part of the public revenues had been derived from the sale of brandy. The exceptional situation created by the war in the latter half of the year enabled the government to introduce sweeping measures for the prohibition of the sale of alcoholic drinks; but as to the absolute character of the prohibition there was still room for doubt.

Premier Goremykine experienced almost as much difficulty with the Duma as had his predecessor. The Duma passed resolutions condemning the influence exercised by the government over the last elections, and deploring the killing of 150 strikers at Lena by gendarmes. The Duma prepared a bill to strengthen the senate against the government. Another bill extended the rights of married women. The budget submitted by the government was contemptuously rejected by the Duma on May 15 by a negative majority of 70 votes. Still further irritation was caused by the announcement that the government had determined to punish the Social Democrat Chheidze for advocating republicanism in a speech before the Duma. Gendarmes

had to be called in to eject the Social Democratic deputies, who caused pandemonium in the Duma by their frantic protests against what they considered a flagrant breach of parliamentary privilege.

FOREIGN RELATIONS. Russian relations with the Triple Alliance were perturbed by several unfortunate circumstances. In the first place, the conflict between German and Russian diplomacy in the Near East had become more than ever irritating. The Germans felt that Russia had offered undue opposition to the German military mission to Turkey (see **TURKEY**). The Russian representative at Sofia had disseminated dissatisfaction regarding the terms of the German loan to Bulgaria (see **BULGARIA**). The Czar's visit to Rumania (see **RUMANIA**) was regarded as a public recognition of the fact that Rumania was being weaned away from her old friendship with the Triple Alliance. To German observers it seemed as if Russia was working more actively than ever before for the union of the Slavic nations under Russian hegemony and the establishment of Russian predominance in the Near East. Another circumstance which caused alarm in Berlin and Vienna was the growth of the Russian army. Coupled with the augmentation of the army was the development of railways which would enormously add to Russia's military strength by facilitating the movement of troops and supplies. The Germans, moreover, felt themselves directly menaced by the triumph of the Three Year Law in France (see **FRANCE**), and the July visit to Russia of M. Poincaré and M. Viviani, confirming the solidarity of the Dual Alliance. Finally, no little agitation was caused by the anticipation that, when the time should shortly arrive for the renewal of the Russo-German commercial treaty, Russia would demand more favorable terms. These various elements of antagonism figured prominently in the alarmist campaign in which the chauvinistic journals of both Russia and Germany engaged. The Russian foreign minister Sazonov, however, speaking before the Duma on May 23, emphatically affirmed the peaceful character of Russian policy and expressed a desire that the jingoistic journalists in Russia as well as in Germany should abandon their provocative polemics.

RUSSIA AT WAR. As the foremost Slavic nation, and as the champion of the small Slav nations of the Balkans, Russia was not inclined to stand by idly when Austria-Hungary, at the close of July, took up arms to punish Serbia for the Sarajevo crime. It is noteworthy that the Russian government at the moment was embarrassed by a serious strike in St. Petersburg (Petrograd). But the abrupt action of Austria-Hungary, and the brusque declaration of war by Germany (August 1), when Russia refused to stop mobilization, called forth a mighty outburst of national enthusiasm which, at least for the moment, drowned all social and industrial disputes. The feeling was extremely bitter against Germany. Excited by the news of the insolent treatment of the Russian ambassador and his party in Berlin, a mob in St. Petersburg smashed the windows of German business houses, threw stones through the windows of the German Embassy, pitched the furniture into the street, and dumped into a nearby canal the two heroic bronze figures which had adorned the roof of the German Embassy. On August 8 the

Czar received the Duma and the Imperial Council in the presence of all his ministers and the generalissimo Grand Duke Nicholas. The Czar's speech is worth quoting: "In these momentous days of excitement and unrest, through which Russia is passing, I bid you welcome. The German Empire and later Austria-Hungary have declared war on Russia. The tremendous outburst of patriotic sentiment, of love and loyalty to the throne which, like a tempest, traversed our entire land, is to me, as it is to you, a pledge! I hope that the great Russia will conduct to a happy conclusion the war which the Lord has sent. From this unanimous storm of love and zeal to sacrifice everything, even life itself, I gain strength to face the future with calmness and fortitude. We are not only defending the dignity and honor of our country, but we are also fighting for our Slavic brothers, our co-religionists and kinsmen. At this moment I behold with joy how the unification of the Slavs with Russia is being strongly and unremittingly carried to completion. I am convinced that each one of you will be found in his place ready to help me stand the test, and that all, beginning with myself, will do their duty. The God of the Russian nation is great!" In token of the patriotic unanimity of Czar and nation, a new flag was adopted, combining the national colors with the imperial arms. Disliking the German sound of the name of the capital, the Russian government substituted the Slavic word Petrograd for the familiar St. Petersburg. While the predominant sentiment in Russia was a militant combination of loyalty to the Czar, zeal for the national orthodox church, and pride in the possession of Slavic as opposed to Germanic culture, at the same time some effort was made to conciliate discontented minorities. The Poles were promised autonomous freedom (see **WAR OF THE NATIONS**). The Roman Catholics, mostly in Poland, were pleased by the Czar's generous pecuniary contribution to the expense of re-building Catholic churches which had been destroyed by the German guns. Jews were allowed to become officers in the army. Leading anarchists with spontaneous enthusiasm espoused the national cause. The Socialists, however, by their international creed opposed to war, and by their party associations friendly to Germany, secretly conducted an anti-war propaganda. Late in November the Petrograd police discovered a revolutionary Socialist plot and arrested a number of Social Democratic leaders, including five members of the Duma—MM. Petrovsky, Badayev, Mouranov, Samoilov, and Chagov. The diminution of the revenues by the prohibition of the sale of alcoholic liquors and the enormous expenditure caused by the war subjected the Russian treasury to a severe strain. Up to the end of October, the war cost Russia 1,795,000,000 rubles (\$892,500,000). To cover expenses, various issues of treasury notes, short-time bonds, and loans had been made, totaling 1,850,000,000 rubles (\$925,000,000). New revenues were to be raised by the levy of a tax on incomes and a personal tax on men absolved from military service. The estimates for 1915 contemplated total ordinary and extraordinary expenditures of 3,234,308,414 rubles, as compared with 3,613,569,398 rubles for 1914.

RUTGERS COLLEGE. An institution for higher education, founded at New Brunswick, N. J., in 1766. The students enrolled in all departments of the college in the autumn of 1914 were 1115, of whom 440 were undergraduates; 450 in the summer session; and 225 in summer short courses. The faculty numbered about 55. The most notable change in the faculty during the year was the resignation of Alexander J. Inglis, professor of the Science of Education. There was a gift of \$45,000 for the purchase of additional campus grounds, and one of \$25,000 for a swimming pool. The endowment of the college is \$739,000, and the annual income \$245,000. The library contains 76,643 volumes. The president is Rev. W. H. S. Demarest, D.D.

RYAN, THOMAS. An American diplomat, died April 5, 1914. He was born in Oxford, N. Y., in 1837, was educated at Dickinson Seminary, Pa., and admitted to the bar in 1861. He served in the Union Army from 1862 until 1864, and in the latter year was mustered out with the rank of captain, on account of wounds received in the battle of the Wilderness. He engaged in the practice of law at Topeka, Kan., from 1865, was county attorney for eight years, and from 1873 to 1877 was Assistant United States Attorney. In 1877 he was elected to Congress and was reelected to successive Congresses up to and including the Fifty-first, but resigned in 1889 to become United States Minister to Mexico, in which post he remained until 1893. He was appointed first assistant secretary of the interior in March, 1897, and served in this office for several years.

RYE. The world's rye production in 1914, as indicated by the estimates for the principal producing countries, was not equal to the high yield of 1913, which amounted to 1,885,000,000 bushels, but it was nevertheless nearly an average crop, which is about 1,750,000,000 bushels. As compared with 1913 the estimated output of rye in 1914 was from three to four per cent smaller, which was largely accounted for by a reduction of about one per cent in acreage. The estimated production of the principal European countries was as follows: Russia 940,000,000 bushels (of which over 6,000,000 bushels were spring and the rest winter rye), Prussia 334,000,000 bushels, Hungary 48,000,000, Spain 29,000,000, Sweden 24,000,000, Belgium 23,000,000, Denmark 19,000,000, the Netherlands 14,000,000, Bulgaria 10,000,000, and Italy 5,000,000 bushels. Asiatic Russia was reported as having produced over 31,000,000 bushels, making a total Russian production of approximately 967,000,000 bushels. In Belgium, Denmark, Spain, Sweden, and Asiatic Russia the production was higher, and in the other countries mentioned, lower than in the preceding year. While comparatively little rye is grown in countries of the southern hemisphere, the acreage in Argentina increased from 32,000 acres in 1910, to 230,000 acres in 1913. Canada devoted 111,280 acres to rye in 1914, and produced, as estimated, about 2,020,000 bushels, mostly in the province of Ontario, the average yield per acre on this basis being approximately 18 bushels as compared with 19.28 bushels the year before. The production of rye in the United States as reported by the Department of Agriculture, amounted to 42,779,000 bushels, grown on 2,-

541,000 acres, at an average yield per acre of 16.8 bushels. In 1913 the rye area was 2,557,000 acres, the total yield 41,381,000 bushels, and the average yield 16.2 bushels per acre. The crop of 1914, based on a bushel value of 86.5 cents, the average price received by farmers December 1, was worth \$37,018,000, the highest total value of the crop ever recorded. While the crop of 1913 was almost as large, its total value, at the corresponding price of 63.4 cents per bushel, was only \$26,220,000. According to data published by the *American Agriculturist*, Wisconsin was the leading State in 1914, with a production of 7,560,000 bushels. The States ranking next, given in their order, were Michigan with 6,460,000, Minnesota with 5,415,000, Pennsylvania with 5,094,000, North Dakota with 2,400,000, and New York with 2,340,000 bushels. The highest average yield per acre by States, 20 bushels, was reported for Iowa, California, and Washington.

SAFETY, NATIONAL COUNCIL FOR INDUSTRIAL. See WORKMEN'S COMPENSATION.

SAFETY AT SEA. The International Conference on Safety at Sea, which had been in session from Nov. 12, 1913, adjourned on Jan. 20, 1914, when a comprehensive convention was signed by the representatives of the United States, Austria-Hungary, Belgium, Denmark, France, Germany, Great Britain, Italy, the Netherlands, Norway, Russia, Spain, and Sweden. This convention was the most important step ever taken by the maritime nations to secure increased safety at sea, and it was ratified in May by the German Reichstag, and on August 10, the British Parliament passed a bill giving it effect. The outbreak of the war in August affected the preliminary steps for ratification in France, Spain, the Netherlands, Belgium, Italy, and Austria-Hungary, where under ordinary circumstances the agreement would have been ratified in the early autumn. As the Parliaments of Denmark and Sweden were not to assemble till early in 1915 the agreement could not be ratified by these bodies until that date. On March 17, 1914, the agreement was transmitted by the President of the United States to the Senate, but was not acted upon by that body until December 16, the ratification being accompanied by a proviso reserving to the United States the right to abrogate treaties, agreements, and conventions and to impose such higher standards of safety and provisions for health, protection, and comfort of passengers, seamen, and immigrants upon all vessels in United States waters as shall be enacted for United States vessels. The consent of the other powers to such modification of the convention seemed unlikely so that it would prove fruitless so far as the United States was concerned. July 1, 1915, was the date stipulated for the agreement to go into effect, but the outbreak of the war naturally affected the general ratification.

The fundamental consideration in this important convention was a Safety Certificate which was to possess certain international attributes. This certificate would signify that the nation which issued it certified that it had inspected and certified the vessel concerned, and that it complied in an efficient manner with the requirements of the nation. The government issuing the safety certificate is bound by the convention

fully to guarantee the completeness and efficiency of the inspection certificate, and it was to be regarded by other governments as having the same force as the certificate issued to their own vessels. Every vessel holding a safety certificate is subject to control by the officers duly authorized by their governments, in so far as this control is directed towards verifying that there is on board a valid safety certificate, and if necessary, that the conditions of the vessel's seaworthiness correspond substantially with particulars of that certificate, or, in other words, that the vessel could proceed without danger to the passengers or crew. The above was incorporated in two important articles of the convention, and the adoption of these two articles was only reached after patient effort, as it involved fundamental principles of international law, and harmonizing the different aspects of the subject held by the different nations. The convention was made to establish international standards and the discussion of various provisions which were elaborated for some 70 pages of printed matter. Instead of a tonnage rule for life boats, the convention adopted the more practical rule that the length of the vessel was the principal factor in determining the number of davits which may be erected, and as the number of davits determines the number of life boats which may be launched promptly, the life boat capacity was to be fixed in relation to the vessel's length. Life boats in excess of the total number of persons on board were not required. The convention rules, it was stated, if complied with during the 5647 transatlantic voyages of passenger ships between the United States and Europe during 1912 and 1913, would have provided life boats for all on board except in 392 cases. The convention further provided for a continuous wireless watch on all vessels equipped with the wireless apparatus, and the master of every vessel is bound to proceed to the assistance of a vessel in distress. The convention applies to all mechanically propelled ocean vessels, which carry more than 12 passengers, in foreign trade between the nations which ratified the convention, but every nation is at liberty to enact its own legislation for coasting trade, and is at liberty to exempt or release from the convention vessels which go less than 200 miles from the nearest coast. The convention also discussed rules of construction, especially those involving subdivisions, or water-tight compartments and bulkheads, which were quite technical, and were discussed in the various countries by organizations of naval engineers. Other topics such as providing an ice patrol, this to be done by the United States government, revision of international regulations for preventing collisions, rules for construction, and maintenance of wireless were provided for in some detail. This convention and report were contained in *Senate Document 463, 63rd Congress, Second Session*, which should be consulted by all specially interested.

SINKING OF EMPRESS OF IRELAND. The year 1914 had its most disastrous maritime catastrophe in the sinking of the Canadian Pacific Steamship, *Empress of Ireland*, in the lower St. Lawrence, about 200 miles from Quebec on May 29, when it was struck by the collier *Storstad*. This collision occurred at 2:12 A. M. in a dense fog, and the total loss of life was 1027 out of the 1479 passengers and crew, sailing from Que-

bec. Of these, 56 of the 92 first-class passengers perished, 209 of 256 second-class, 582 of 718 third-class, and 180 of the crew of 413 were lost. This disaster gave rise to an inquiry conducted by a commission composed of Lord Mersey, Sir Adolphe Routhier of Quebec, and Chief Justice McLeod.

Discussion was aroused, soon after the disaster, as to why the *Empress of Ireland* sunk so quickly, being a comparatively new vessel, built in 1906, with 4 complete steel decks from stem to stern, and with 10 transverse water-tight bulkheads, terminating in each case at the upper deck. These bulkheads were designed in accordance with recommendations of the British Board of Trade Bulkhead Committee of 1891, and two adjacent compartments could be flooded without sinking the ship below the margin of safety down below the upper deck. There were 24 water-tight doors in these transverse bulkheads, all of which apparently were open at the time of the collision, and the Board of Inquiry after hearing the evidence concluded that nearly all the water-tight doors on the starboard side were open, and those on the upper deck remained open after the collision, while a large proportion of the porthole openings in the side of the ship were also open after the collision occurred. The stem of the *Storstad* penetrated the side of the *Empress of Ireland* some 21 feet, making a hole of about 46 feet, some 25 feet of which was below the water line. As the collision occurred in the immediate vicinity of water-tight bulkheads between the two boiler rooms, these compartments were immediately flooded, and as the water-tight doors were open, the adjoining compartments were flooded also. The commission of inquiry in closing its report suggested, that in foggy weather, it would be desirable to close all water-tight doors and portholes below the top of the water-tight bulkheads, and that, whenever practicable, water-tight doors and bulkheads should be closed at sunset and kept closed until sunrise. Furthermore, as the ship foundered so soon after the collision, there was little or no opportunity to use the life-saving appliances on board, and this was rendered still more difficult by the list to port which the vessel received, so as to render useless the life boats of the port side of the vessel. In fact they were worse than useless and even injured people as they clattered down the sloping decks. Of the life boats on the starboard side, only six were launched, and the question arose whether rafts should not be placed in such a position on the upper deck that they would float automatically on the water as the ship sank. The Commission of Inquiry, in its report on July 7, blamed Third Officer Tufenes of the collier, stating that he was wrong and negligent in laying his course, and negligent in keeping the navigation of the vessel in his own hands and failing to call the captain, when the fog was seen coming on.

An extraordinary condition of the collision was that it was due to a blunder, as the vessels sighted each other when more than three miles apart, and were traveling on courses which would have allowed them to pass in safety. The change of course on the part of the third officer was fatal. Another defect, that possibly calls for remedy in future construction, was the fact that there was no way available to close the bulkhead doors from the bridge. The disaster

called attention to the need of better measures for safeguarding navigation in fogs, especially on such waterways as the St. Lawrence River, and it was suggested that compulsory use of submarine bells in such navigation might be advantageous.

OTHER DISASTERS. Another disastrous ship collision on the St. Lawrence River caused the loss of 14 persons, when the government steamer *Montmagny* was rammed by the Black Diamond collier *Lingan*, at 5 o'clock on the morning of September 18, in a fog on the Beaujean Banks, 1 mile below Crane Island, and 26 miles from Quebec. The *Montmagny*, which sank in three minutes after the collision, was a steel twin screw steamer of 1269 registered tonnage, employed in the Department of Marine Fisheries, while the *Lingan* was a collier of the same type as the *Storstad* which sunk the *Empress of Ireland*. She was of 4348 tons burden, and was bound for Montreal.

A serious collision occurred in the English Channel on June 17, when the *Kaiser Wilhelm, II* of the North German Lloyd Line and the 3000 ton grain steamer, *Incemore*, met in collision. The *Kaiser Wilhelm, II* was struck amidships, on the starboard side, as she was near the Needles, and was compelled to return to her anchorage off Southampton, where the passengers were transferred to the *Imperator*, which left Southampton the following day. The *Incemore* was badly damaged about the bow, and was compelled to put into port immediately.

The steamship *Monroe* of the Old Dominion Line was sunk, on January 31, by collision with the steamship *Nantucket* of the Merchants and Miners' Line, in a light fog at 2:00 A. M., about 50 miles off the Virginia Capes. The *Monroe* was struck on her starboard side, just forward of the pilot house, and proceeded to fill rapidly, so that about 4 minutes after the collision occurred she was nearly on her beam ends, and it was only possible to launch the lifeboats on the starboard side, and of these one sank in the collision, and one was swamped while being launched. Within 10 minutes the *Monroe* foundered in about 15 fathoms of water, and some of the passengers that were not saved in her own boats were picked up by the boats from the *Nantucket*, 19 passengers and 22 of the crew being lost. An official inquiry held the captain of the *Nantucket* guilty of negligence and his license was revoked. It was stated that the *Monroe* could have been seen nearly a mile away, and that on hearing her wheels the *Nantucket* could have so changed her course as to have avoided the collision.

The *Admiral Sampson* of the Pacific Alaska Navigation Company was sunk off Point-No-Point, Wash., on August 26, as the result of a collision with the Canadian Pacific steamer, *Princess Victoria*. The collision occurred in a heavy fog with both vessels proceeding under reduced speed, and the *Admiral Sampson* sank in 4 minutes, with a loss of 11 lives. The *Princess Victoria* struck the other ship directly on a line with the after hatch, opening a 12-foot gash in the hull and crushing several large containers of fuel oil, which caught fire. This compelled the *Princess Victoria* to back away, as flames enveloped both vessels, so that she could no longer keep her nose pressed into the hole. The *Admiral Sampson* was of 2262 gross tons, and 16 years old.

SAFETY FIRST. See RAILWAY ACCIDENTS; and WORKMEN'S COMPENSATION.

ST. HELENA. An island in the South Atlantic; a British possession. It is distant from Cape Town 1695 miles, and has an area of 47 square miles. The census of May, 1901, returned a population of 9850, of whom 4636 were Boer prisoners of war, and 1428 were members of the garrison. The census of April, 1911, returned 3520 inhabitants, including the garrison staff and 43 sailors of ships in port. Jamestown is the capital and only town, with 1439 inhabitants. St. Helena is a supply station for ships in transit, and has never produced any article for export excepting flax fibre. An effort is being made to revive this industry. Imports and exports for 1912 totaled £41,749 and £6150 respectively. Revenue 1912, £10,042; expenditure, £9449. The Governor in 1914 was Major H. E. S. Cordeaux.

ST. KITTS AND NEVIS. West Indian islands constituting, with Anguilla, a presidency of the Leeward Islands colony (q.v.). St. Kitts, or St. Christopher, has an area of 68 square miles, Nevis 50, and Anguilla 35. The total population was 43,303 in 1911. About 17,000 acres are planted to sugar cane, and 5000 to cotton. The export of sugar for 1911 was 11,130 tons; molasses, 2339 puncheons; rum, 19,380 gallons; sea-island cotton, 782,933 pounds. Stock raising is practiced. Total imports for 1912 were valued at £252,637 (£306,666 in 1911); exports, £187,961 (£190,747). Revenue 1912-13, £57,228 (£58,002 in 1911-12); expenditure, £53,508 (£50,736). Total tonnage entered and cleared 1912-13, 684,445, of which 583,272 tons British. Public debt 1912-13, £46,854. Customs revenue 1912-13, £36,203. Administrator, 1914, T. L. Roxburgh (appointed 1913). Basseterre is the capital. See LEeward ISLANDS.

ST. LUCIA. A British West Indian island; one of the Windward Islands colonies. Area, 233.29 square miles, with (1911) 48,637 inhabitants. The capital is Castries, with 6266 inhabitants; it has a good harbor and is a port of registry. The town of Soufrière has about 2300 inhabitants. Products for export are sugar, cacao, logwood, and spices. Limes are being extensively planted, and rubber and cotton grow well. Imports and exports for the year 1912 were valued at £316,361 and £287,716 respectively. Revenue 1912-13, £66,293; expenditures, £67,825. Shipping entered and cleared, 3,490,042 tons, of which 2,980,840 tons British. The Administrator in 1914 was E. J. Cameron, appointed 1909.

ST. MARYS FALLS CANAL. See CANALS.

SAINT-PIERRE AND MIQUELON. A French colony off the southeastern coast of Newfoundland, including some smaller islands. Area, 241 square kilometers (93 square miles), carrying a population of 6482. Imports, 1912, 5,179,422; exports, 6,002,982. Vessels entered in the 1911 trade, 150, of 63,264 tons. The budget balanced in 1911 at 503,000 francs; the debt stood Jan. 1, 1912, at 332,000 francs. The Administrator in 1914 was M. Marchand.

ST. THOMAS. See SÃO THOMÉ.

ST. VINCENT. A British West Indian island; one of the Windward Island colonies. It occupies between 140 and 150 square miles, and had, in 1911, 41,877 inhabitants (estimate of March 31, 1912, 43,117; March 31, 1913, 44,434). Kingstown, a port of registry situated at

the southwestern extremity of the island, had 4300 inhabitants in 1911. Other towns are Georgetown and Barrouallie. The island is of volcanic origin; the Soufrière was in eruption in March, 1903. Products for export are sugar, rum, cacao, arrow root, ground nuts, and spices. Imports and exports for the year 1912 were valued at £129,142 and £111,684 respectively. Revenue 1912-13, £38,088; expenditure, £33,993. Tonnage entered and cleared, 1912-13, 332,449, of which 298,925 tons British. Customs revenue, 1912-13, £18,311. The Administrator, in 1914, was C. Gideon Murray, appointed in 1909.

SAKHALIN. An island off the eastern coast of Siberia. The entire island was formerly Russian, but that part of it south of the 50th parallel was ceded to Japan by the treaty of Portsmouth, Sept. 5, 1905, and is called Karafuto. It has an area of 13,155 square miles, carrying an estimated population of 42,612 in 1913. Russian Sakhalin covers 16,370 square miles, with 12,000 inhabitants. There are valuable and extensive forests, but at present the fisheries are the most important source of wealth.

SAKURA-JIMA. See VOLCANOES.

SALEM, GREAT FIRE OF 1914. See MASSACHUSETTS, *Other Events*.

SALVADOR. A Central American republic, situated on the Pacific coast and bordering Guatemala and Honduras. Capital, San Salvador.

AREA AND POPULATION. Salvador is one of the most densely populated countries of America. Its estimated area is 21,160 square kilometers, and its estimated population (1913) upwards of 1,200,000. Although the people are largely mestizo and Indian, they have achieved a considerable degree of economic development and political stability. Town populations are not known with certainty. Estimates for San Salvador vary between 60,000 and 75,000. The population of Santa Ana has been estimated as high as 59,000; San Miguel is supposed to have about 25,000 inhabitants; Ahuachapán, San Vicente, and Chalchuapa, over 20,000 each; Zacatecoluca, about 20,000; Nueva San Salvador, about 19,000; Sonsonate, about 17,000.

EDUCATION. Primary instruction is free and nominally compulsory, but the majority of children do not attend school. The government, however, is directing its attention to education, establishing many new schools; the 1913 budget provided for 137 new schools, of which 60 were rural schools and 77 night schools. In 1913, there were in operation 856 schools, with an enrollment of 50,550 and an average attendance of 38,121. Of the schools, 711 were government schools, 91 municipal, 7 charity, and 47 private. In addition, there are 3 normal schools, 3 technical schools, 14 other schools of advanced rank, and a university.

PRODUCTION AND COMMERCE. The leading crop is coffee. Other agricultural products of importance are cacao, sugar cane, bananas, tobacco, rice, and indigo. There is also an output of rubber and balsam. Mining, especially that of gold and silver, is increasing in importance.

Imports, in 1912, were valued at \$6,774,859, and exports, 22,341,987 pesos (silver); in 1913, imports, \$6,173,545, and exports, 23,527,782 pesos. As the estimated value of the peso, in 1912, was 44.5 and in 1913, 42.2 cents, the exports had in these years gold values approximating \$9,942,184 and \$9,928,724 respectively.

Import and export values, in thousands of dollars, are reported as follows:

	1909	1910	1911	1912	1913
Imports	4,177	3,745	5,114	6,775	6,174
Exports	6,861	7,298	9,439	9,942	9,929

Leading imports in 1912 and 1913 respectively, in thousands of dollars: cotton cloth and manufactures thereof, 2017 and 1477; hardware, 564 and 760; drugs and medicines, 419 and 478; machinery, 276 and 334; flour, 393 and 333; boots, shoes, and findings, 214 and 235; cotton yarn, 181 and 167.

Principal exports in 1912 and 1913 respectively, in thousands of dollars: coffee, clean, 7611 and 7810; coffee in parchment, 154 and 97; gold in bars, 608 and 581; gold and silver amalgams, concentrates, etc., 799 and 974; silver in bars, 148 and 22; panels, 78 and 94; sugar, 168 and 77; indigo, 95 and 56; cattle hides, 70 and 94. Trade by principal countries, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United States	2,628	2,491	2,958	2,824
United Kingdom	1,905	1,604	445	706
Germany	665	714	2,295	1,700
France	397	418	1,510	2,030
Italy	288	225	941	1,208
Belgium	225	204	11	1
Total, including other ..	6,775	6,174	9,942	9,929

COMMUNICATIONS. The length of railway open to traffic, in 1912, is reported at 198 miles. A line from San Miguel to Usulután was opened to traffic in 1913, and one from San Salvador to La Libertad in 1914. Telegraph offices (1912), 203, with 3788 kilometers of line; post offices, 117.

FINANCE. The value of the peso fluctuates with the price of silver; in 1910, the peso was worth about 40 cents, in 1911 about 42.5 cents, in 1912 about 44.5 cents, and in 1913 about 42.2 cents. The budget for the year, 1914-15, showed estimated revenue of 14,896,850 pesos and estimated expenditures of 14,843,313 pesos. It was estimated that, of the revenue, 9,645,750 pesos would be derived from customs. Public debt, Jan. 1, 1913: foreign, 17,729,022 pesos; internal, 6,434,544; treasury bonds, 3,730,770; total, 27,897,337.

GOVERNMENT. The legislative power is vested by the constitution in the National Assembly, consisting of 42 members elected annually by direct vote. The President is elected by direct vote for four years. There is a Cabinet of four members. On March 1, 1911, Manuel Enrique Araujo was inaugurated President, succeeding Gen. Fernando Figueroa. President Araujo was assassinated in February, 1913, dying on the 9th of the month. He was succeeded by Carlos Meléndez. President Meléndez resigned in August, 1914, and was succeeded on the 29th of that month by Alfonso Quiñónez Molina.

By a new finance law inheritance taxes were imposed, ranging as high as 10 per cent on the inheritance of estates of over 100,000 pesos, by distantly related or unrelated heirs. See INTERNATIONAL ARBITRATION AND PEACE, *Bryan-Wilson Treaties*.

SALVARSAN. The undoubted improvement under salvarsan in cases of central nervous diseases which have a syphilitic basis led to at-

tempts to introduce the drug into the cerebro-spinal fluid. It had been found that intramuscular or intravenous injections were not nearly so effective. Neosalvarsan in aqueous solution was injected into the spinal canal by numerous clinicians. The results were dubious, and the patient suffered from extreme headache, vomiting, severe neuralgic pains, and a rise in temperature. Salvarsanized serum is serum drawn from an individual who has had an injection of salvarsan at a sufficient length of time before, to allow the development of antibodies. If the serum is drawn too soon after the salvarsan is given, more or less of the drug is still in the serum. Two or three days should elapse, according to Beriel and Durand, before drawing serum for therapeutic use. Salvarsanized serum had been used with excellent effect in locomotor ataxia and with less notable success in paresis, but patients having any nervous disease, which could be shown to be due to syphilis, were markedly benefited. In progressive paralysis Runge obtained remissions in 3.9 per cent of 380 cases in which no previous treatment had been taken, in 9.3 per cent of 140 cases treated with iodide alone, and 11.4 per cent of 35 cases treated with mercury alone. The amount of improvement seemed to be proportional to the dosage and to the promptness with which salvarsan treatment was administered. Salvarsanized serum had been injected into the spinal canal and into the cerebral ventricles. Deaths continued to be reported following the administration of both salvarsan and neosalvarsan, the latter drug being supposedly much safer than the former. Many of the fatalities occurred in young, vigorous subjects, without organic disease of any kind other than syphilis. The French school of physicians had always been somewhat antagonistic to the drug, and a prominent Berlin dermatologist, Dreuw, had also written an article presenting its dangers. From a review of the literature and communications with other dermatologists, he collected nearly 300 cases of death following salvarsan injection, together with a number of cases of blindness. Schmitt, on the other hand, analyzing 274 cases on record, found that in a large proportion of the instances there was no connection between the drug and fatalities. In others the dosage was excessive and the intervals between doses too brief.

SALVATION ARMY. There were in the Salvation Army, in 1914, 852 corps and outposts. There were held, during the year, 197,099 indoor meetings at which there was an attendance of 7,646,760 persons. In addition were held 150,065 open air meetings. The army maintains 92 hotels, accommodating 6896 persons, and also conducts 118 industrial homes, accommodating 3041 persons, to which were admitted, in 1914, 16,959 men. The slum work is carried on by 16 posts, and, in 1914, 29,225 families were visited and 80,639 persons temporarily assisted. There are 28 rescue and maternity homes, accommodating 839 persons, and 5 children's homes, accommodating 385 children. In connection with the prison work of the army, 1674 were assisted on discharge, during the year, and 229 situations were found on discharge of prisoners. The army took an active part in war relief, in the latter part of 1914, and accumulated great quantities of clothing which were sent to Europe. The army occupies 58 coun-

tries and colonies, and salvation is preached in 34 different languages.

SAMOS. One of the Anatolian islands; a more or less independent principality tributary to the Porte until November, 1912, since which date it has been administered by a Greek Governor—M. Sephoulis, the former leader of the Popular party in Samos against the Turks. Area, 468 square kilometers (181 square miles), with 53,424 inhabitants (1902), besides 15,000 natives of Samos residing on the Anatolian shore. Vathy, with about 8000 inhabitants, is the capital. Imports, 1911, 37,036,352 piasters; exports, 19,741,212 piasters. The chief exports are wine, raisins, leather, oil, cigarettes, spirits, and carobs. Estimated revenue, 1910, 3,851,660 piasters; expenditure, 3,627,496 piasters. Debt, 2,570,500 piasters.

SAN GIULIANO, MARQUIS DI. Italian statesman, died Oct. 16, 1914. He was born in Catania in 1852, of a Norman-Sicilian family. Early in life he entered politics and in 1892 was appointed under-secretary of state for agriculture, in the first Giolitti cabinet, in which post he shared the discredit which the Banca Romana scandal cast upon the members of the administration. In 1899 he attained cabinet rank as Minister of Posts and Telegraphs, in the second Pelloux cabinet. He had long cherished an ambition to be Minister of Foreign Affairs, a position for which he prepared himself by travel and study, and this ambition was finally achieved in December, 1905, when he was given the foreign portfolio in a cabinet formed by Signor Fortis. In the following year he was appointed foreign ambassador in London, a position which he held until 1910, when he became foreign minister in the Luzzatti cabinet, retaining this post in the succeeding Giolitti and Salandra administrations. His last notable act was the declaration of Italian neutrality at the beginning of the European War. In the last years of his life his activities were handicapped by persistent ill-health.

SANITATION. See GARBAGE AND REFUSE DISPOSAL; HYGIENE; SEWAGE PURIFICATION; TROPICAL DISEASES; and WATER PURIFICATION.

SANTO DOMINGO. See DOMINICAN REPUBLIC.

SÃO THOMÉ AND PRÍNCIPE. Two islands in the Atlantic off the coast of French Equatorial Africa, constituting a Portuguese dependency. Area, 939 square kilometers (374 square miles), carrying a population estimated, in 1909, at 68,221. The islands form one of the most important sources of the world's supply of cacao. The imports and exports for 1910 were valued at 3,197,830 and 9,896,000 milreis respectively. The 1910-11 budget estimated the revenue at 931,429 milreis, and the expenditure at 703,315 milreis. The colony is administered by a Governor.

SAPPHIRE. See GEMS AND PRECIOUS STONES.

SARATOGA SPRINGS. The board of commissioners of the New York State Reservation at Saratoga Springs issued promptly, on Jan.

1, 1915, their report for the preceding year. They show great progress in the preparation of parks for use of invalids, with walks and climbs for the Oertel exercises; in the construction of the Pine Promenade, a mile in length, for pedestrians and wheel chairs; the creation of zones of safety about some spring areas; of the control and proper administration of hydrotherapeutic measures in the village; the erection and equipment of a laboratory for water analysis, chemical and bacteriological; a consolidated bottling works wherein five mineral waters are bottled with natural gas in solution; many repeated analyses of mineral waters, some showing a steady increase in medicinal ingredients; and especially the equipment of the Lincoln Bath House, to be prepared by May 1, 1915, for the exhibition of 325 daily treatments during the usual bathing hours, comprising Nauheim baths, colon irrigations, Baruch's neuro-vascular training, massage, etc. The State hopes to acquire, in January, the private bath house known as Saratoga Baths, wherein, after renovation and installation of new equipment, 250 treatments a day may be given, under competent direction. The Congress Spring has been reclaimed and will be added to the list of bottled waters, now comprising the Hathorn No. 1, Hathorn No. 2, Coesa (formerly Carlsbad), Orenda (formerly Adams), Minnebone, and Geyser springs. Dr. Albert Warren Ferris continues to be the director, Prof. Charles G. Anthony is the engineer, Herbert Ant is the chemist, Louis W. Noland is secretary to the commissioners, who are Hon. George Foster Peabody, Gen. Benjamin F. Tracy, and Hon. Frank N. Godfrey, and serve without remuneration. See HYDROTHERAPY.

SARAWAK. The northwestern portion of the Island of Borneo; a British protectorate. Area, about 42,000 square miles, with an estimated population of 500,000. Kuching, with 25,000 inhabitants, is the capital. Sibu has a large Chinese population, mostly traders, and the Rejang River has a raft population of some 90,000. Total imports and exports amounted, in 1911, to S.S.\$8,572,824 and S.S.\$9,563,485 respectively. The revenue for 1911 was given at S.S.\$1,420,420, and the expenditure at S.S.\$1,341,761. The acting Rajah is Charles Vyner Brooke.

SASKATCHEWAN. A province of the Dominion of Canada. Area, 251,700 square miles, with a population (1911) of 492,432. The capital is Regina, with (1912) 30,213 inhabitants. The population has increased enormously since the census was taken. The province is administered by a Lieutenant-Governor, appointed by the Governor-General of Canada, and acting through a responsible executive council. There is a unicameral legislative assembly of 41 elective members. The Lieutenant-Governor, in 1914, was George William Brown, appointed Oct. 5, 1910. Premier, in 1914, Walter Scott. See CANADA.

SAULTE STE. MARIE CANAL. See CANALS.

SAVINGS BANKS. In the United States commercial savings banks are of two classes, mutual and stock. (See, for postal savings, the article on POSTAL SAVINGS BANKS.) The former are found more frequently in New England and the Eastern States, while the latter prevail through the Middle West. On June 30, 1914, there was a total of 2100 savings banks in the

United States of which 634 were mutual and 1466 stock. Their aggregate deposits were \$4,936,591,000, credited to 11,109,499 depositors, or \$444.36 per depositor. There was an increase during the year of \$109,188,000 in deposits, and of 343,000 in the number of depositors. New England States were credited with 3,653,000 depositors and \$1,543,121,000 deposits; Eastern States, 4,422,000 depositors, and \$2,253,737,000 deposits; Southern States, 430,687 depositors, and \$97,600,000 deposits; Middle Western States, 1,533,780 depositors, and \$529,698,000 deposits; Western States, 56,816 depositors, and \$11,926,000 deposits; Pacific States, 1,012,652 depositors, and \$500,507,000 deposits. New York had nearly 30 per cent of the depositors and more than one-third of the deposits; Massachusetts ranked second with one-fifth of the depositors and 18 per cent of the deposits. Other States ranking high were Connecticut, Pennsylvania, Michigan, Ohio, and California. The growth of savings banks in the United States is sufficiently indicated by the fact that they more than doubled in number since 1902; depositors in that time increased 67 per cent; and deposits nearly doubled.

Mutual savings banks, though less numerous, are much more important in the aggregate than the stock savings banks. On June 30 they held \$3,915,626,000 deposits, credited to 8,277,359 depositors. They thus held four-fifths of all savings bank deposits and had three-fourths of all depositors. They are distributed as follows: New England States, 412; Eastern States, 199; West Virginia, 1; Middle Western States, 21; and California, 1.

The stock savings banks had 2,228,020 savings depositors and 604,120 commercial accounts. They held \$752,785,000 savings deposits; and \$268,178,000 other deposits.

The table on page 627, compiled by the Bureau of Foreign and Domestic Commerce from office reports, gives the latest statistics for savings banks of the world, including postal savings banks:

SAVINGS BANK INSURANCE. The annual report of the State actuary of Massachusetts showed that the four savings banks of that State issuing insurance policies had, in the year ending October 31, issued 2408 policies representing \$783,962 insurance. During the year there was a net gain of 1385 policies, and \$415,972 insurance. The total number of policies in force was 9439, amounting to \$3,566,000. The total premium income for the year was \$139,753; interest income, \$20,563. Disbursements included \$9706 in death claims, \$12,422 in dividends, and \$12,826 in surrender values. Very large dividends were paid to policy holders, amounting in some cases to as much as 67½ per cent of the year's premium. See also POSTAL SAVINGS BANKS.

SCADDING, CHARLES. An American Protestant Episcopal Bishop of Oregon, died May 27, 1914. He was born in Toronto, Canada, in 1861, and graduated from Trinity College, Toronto, in 1885. From 1886 to 1890 he was assistant pastor of St. George's Church, N. Y., and in 1891 was rector of Christ Church, Middletown, N. Y. He was consecrated Bishop of

Oregon in 1906. He was lecturer for the London Society for the Propagation of the Gospel and wrote several books and many tracts.

SCANDINAVIAN LITERATURE.* **DANISH.** *Drama.* The drama of to-day seems to have for its purpose not so much to present anything new, as to present in new light facts already known. The theatre has become a battle field for the conflict of ideas and the defense of certain theories. Thus in Julius Magnussen's *Skyldig eller ikke skyldig* ('Guilty or not Guilty') the author tries to force on us the conviction that the troubles of the hero schoolboy are due, not to himself, but to the teachers and the school. P. C. V. Hansen's *Hyttefadet* ('The Fishtrunk') shows the effects of social elevation on a socialist leader and his political views. *Dora van Deken*, a dramatization of Henrik Pontoppidan's story, *Lille Rødhætte* ('Little Red Riding Hood'), shows us the fight of the heroine against society at large in behalf of her child. In the play, *I Rungsted Kro* ('In the Tavern of Rungsted'), Olaf Hansen shows a wonderful familiarity with the disappointments and sorrows incident to the poet's life. The play treats of the life of Johannes Ewald and is written in verse.

Fiction. In Knud Hjørtø's *Fru Herta* ('Lady Herta') we see a romantic situation translated into realism—it is the eternal conflict between the light and the dark. The heroine marries a man of lower social rank than herself, but we are made to see the influence of his optimistic, conquering nature on her. This book makes easy reading, which is more than can generally be said of this author's work. In *Lykkens Veje* ('The Paths of Happiness') Poul Levin gives us a sketch of Copenhagen life executed with a firm and steady hand. Gustav Wied's *Imellem Slagene* ('Between the Battles') consists of little sketches and comedies, and also of a larger work in the form of a diary relating the romance of a wine dealer who has "loved and lost." In Svend Leopold's *Omkring Parnasset og andre Materier* ('Around Parnassus and Other Subjects') the best is a sketch of the duchy of Braunschweig called *Det Lille Rige* ('The Small Country').

NORWEGIAN. *Poetry.* Olaf Bull's *Nye Digte* ('New Poems'), which remind one of Wergeland, show a wonderful poetic imagination. Bull has the power of creating, back of the things he treats, a mystic fable world of his own.

Drama. Sigurd Ibsen, the son of the late Henrik Ibsen, has departed once from his regular form of writing, the essay, and has tried his hand at a tragedy, *Robert Frank*. It depicts the defeat and death of a man of political ambitions, whose fall is brought about by his love. The moral of the play seems to be that defeat of some sort is nearly always the price of greatness.

Jubilee Literature. The year 1914 was the 100th anniversary of the liberation of Norway from Danish rule and its union with Sweden as an independent kingdom. Hence there has been a great deal of jubilee literature throughout the country. The main production of this kind is the official publication, *Eidsvoll 1814* (place and date of the adoption of the constitution). It appeared in twenty volumes, both

in Dano-Norwegian and in the Landsmaal (see *Landsmaal N. O.* vol. ii). *Norges storming 1814-1914* (15 vols.) describes the origin and development of the *Storming* through the century and contains about 300 biographies. Angell's *Syvårskrigen* ('The Seven Years of War') describes the war preceding the liberation. A splendid work in its line is Erik Vullum's *Hvorledes Norge blev frit* ('How Norway Became Free') which presents the events of the time in their relation to general European history. A collection of monographs and dissertations from the historical seminar, edited by Halvdan Koht, show a great deal of care and scholarship in their preparation.

Literary Criticism. Throughout the three Scandinavian countries a growing interest in literary criticism, indigenous and foreign, has of late years manifested itself in Norway by the launching this year of the new periodical, *Edda*, which has as contributors some of the greatest scholars in and outside of Scandinavia, and which deals with widely different literatures.

SWEDISH. The idealistic trend which has existed for the last few years in Swedish literature has not subsided much during the year, as is attested by the fact that Selma Lagerlöf was elected as one of the 18 immortals of the Swedish Academy—the first woman to receive this distinction.

Drama. In the comedy, *Janssons frestelse* ('The Temptation of Jansson'), by the popular actor, Sigurd Wallen, we have a very creditable attempt at putting real peasants on the stage. Arnold Munthe made his debut with a play, sketching, in four acts, the last four unhappy years of Magnus Stenbock. This play is a proof not only of good dramatic technique but also of deep historical insight.

Fiction. In Gustaf Hellström's *Kring en Kvinna* ('Around a Woman') we see how a woman of quite ordinary character influences profoundly the lives and fates of the men surrounding her, driving some of them even to insanity and suicide. Algot Ruthe's *De två nationerna* ('The Two Nations') is a novel treating social problems, particularly the labor question and Socialism, and giving the author's own impressions from the battlefield of the latter. Interwoven with the development of the ideas in the book is a little love story which, in its way, throws light on the problems. Erik Fahlman's *Firman Åbergson* ('The Åbergson Co.'), the first production of the author, is a work of sound and rugged realism, reproducing and interpreting a section of middle-class life. Sigfried Siwertz has given us a volume of short stories, *Ämbetsmän på äfventyr* ('Officials on Adventures'), which is idyllic throughout, and which still shows the author's interest in the psychologic situation. Other collections of short stories are Ture Janson's *Knock me down*, tales from Helsingfors's life, written by a Finlander, and *Äfventyrens land* ('The Land of Adventures') by Marika Stjernstedt.

Miscellaneous. *Gudstrons Uppkomst* ('The Origin of a Belief in a God'), by Nathan Söderblom, traces the religious element in man. A new edition of Runeberg's *Fäurik Ståls Sägner* ('The Tales of Ensign Stål'), edited by Ruben Berg and Ivar Hjertén, constitute an important contribution to Runeberg criticism.

SCARBOROUGH, JOHN. An American

* On account of the interruptions of intercourse with Europe during the war, this article is of necessity incomplete.

Bishop of the Protestant Episcopal Church, died March 14, 1914. He was born in Castleweliam, Ireland, in 1831. At an early age he removed to the United States and settled in New York where he was prepared for Trinity College, Hartford; upon graduating from this institution in 1854 he entered the General Theological Seminary in New York City, graduating in 1857, and later receiving the degree of S.T.D. from Trinity College. In the following year he became assistant at St. Paul's Church, Troy, N. Y., and two years later was made rector of the Church of the Holy Comforter at Poughkeepsie, serving there for seven years. He was then appointed a rector of Trinity Church, Pittsburgh, and there he served until his ordination as Bishop of New Jersey, Feb. 2, 1875. He was fourth in seniority among the Protestant Episcopal bishops in the United States.

SCHUCH, ERNST VON. A German operatic conductor, died May 10, 1914. He was born in Graz in 1847, and studied at the gymnasium of that city, then attended the university with the purpose of practicing law, but soon returned to the study of music and acted as conductor in Breslau, Würzburg, and other cities. For a time he traveled as conductor of the company of Désirée Artôt, and after her retirement he became conductor at the Dresden Opera House, which he raised to a higher artistic level than any other opera house in Germany. He conducted the first appearance of Marcella Sembrich and Ernestine Schumann-Heink at this opera house. In 1898 he visited the United States and directed several concerts at the Metropolitan Opera House. He was selected by Ignace Paderewski to conduct his *Manru* for the first time in Germany, and he also conducted the first performances of Strauss' *Salome*, *Elektra*, and *Der Rosenkavalier*. He retired from the direction of the Royal Opera House in Dresden several months before his death, being at the time of his retirement the most famous operatic conductor in Europe.

SCHUYLER, MONTGOMERY. An American art critic and journalist, died July 16, 1914. He was born in Ithaca, N. Y., in 1843, and entered Hobart College in 1858, but did not graduate. In the Civil War period he removed to New York City and almost immediately entered upon the work in which he afterwards became distinguished. In 1868 he joined the staff of the *New York World* and at once attracted attention in literary circles by his forceful, thoughtful, and scholarly articles. Drawn by his artistic and musical tastes to specialize along these lines, he became known as one of the great architectural critics, and after the death of Russell Sturgis was acknowledged to be the leading architectural critic in the United States. In 1883 he left the *World* and joined the editorial staff of the *Times*, remaining there until 1907, when he retired from active newspaper work and removed to New Rochelle.

From 1885 to 1887 he was managing editor of *Harper's Weekly* and from the latter year until 1894 continued to be a reader for Harper & Bros. In 1912 he joined the staff of the *New York Sun* as a special writer on books. From 1907 until his death he was at work on a *History of Architecture in the United States*, a monumental work, which unfortunately he left unfinished. He was a member of the National Institute of Arts and Letters and many other societies and organizations. He wrote poems and critical papers for many magazines, and in 1892 he published *Studies in American Architecture*, and in 1906, *Westward—The Course of Empire*; he was also author of *The Brooklyn Bridge* with W. C. Conant.

SELANGOR. A State of the Federated Malay States protectorate (q.v.), on the western shore of the Malay Peninsula. It has a coast line of about 125 miles. It is watered by the Bernam, the Selangor, the Klang, and the Langkat rivers. The inhabitants are said to be descended from Celebes colonists. Coffee cultivation, formerly a prominent industry, has greatly declined. The cultivation of rubber has greatly developed, the area alienated in 1912 for this object being 313,142 acres, of which 170,843 acres were immediately planted. The rubber exported during 1912 was valued at S.S.\$33,023,110. There are 30,308 acres planted to coconuts; and rice, gambier, pepper, etc. are grown. Tin mining is the principal industry, the area alienated for mining being 73,734 acres; 68,000 Chinese are employed in the mines. The 1912 tin export was 255,382 piculs, valued at S.S.\$26,394,751. There are 656 miles of metaled and 64 of graveled roads, besides 174 miles of by-paths. Kuala Lumpur, with 46,718 inhabitants, the capital of the State and headquarters for the protectorate administration, is the largest town on the mainland of the peninsula. It has public gardens, containing about 180 acres, and imposing government buildings. Port Swettenham is the chief port. Import duties are levied on opium and spirits. Aggregate tonnage registered in 1912, excluding native craft, 2,902,677. The native ruler is Sir Ala'idin Suleiman bin Almerhum Raja Musa. The British Resident in 1914 was E. G. Brodrick.

SENATORS, DIRECT ELECTION OF. See ELECTORAL REFORM.

SENEGAL. One of the colonies composing the French West Africa government-general. The capital is Saint-Louis. The area as given in the *Annuaire Statistique* differs somewhat from that reported by the Colonial Office publications (for the latter see FRENCH WEST AFRICA), being 192,000 square kilometers. The population differs also, the *Annuaire* reporting 1,247,979—888,467 Mohammedans, and 346,333 fetichists, the remainder being European Chris-

tians. The population of the principal towns is given by the same publication: Dakar, 25,630 (2307 French); Saint-Louis, 22,276 (896); Rufisque, 12,490 (311); Tivavouane, 3443 (96); Thies, 2397 (129); Louga 1806 (84); Gorée, 1140 (45).

A primitive agriculture is the main industry, and tropical fruits and plants are grown. The chief products for export are ground nuts, gums, rubber, palm kernels, wax, etc. Grazing is practiced, and large herds of cattle, sheep and goats, camels, and horses are owned by the nomad tribes. The total imports, for the year 1912, were valued at 67,859,907 francs—cotton textiles, 9,539,713 francs; rice, 4,951,476; kola nuts, 3,384,892; sugar, 3,035,022; guinea (blue cotton cloth), 2,796,231; wine, 1,672,326; comestible oils, 1,459,143; leaf tobacco, 1,294,167; wheat flour, 1,251,615; alcohol and brandy, 1,235,534; construction material, 1,232,860; sea biscuit, 1,078,422; coal, 9,457,802. The total exports were valued at 56,019,804 francs—ground nuts, 41,161,966; gums, 2,315,494; rubber, 1,077,011; palm kernels, 705,514; cattle, 263,500 (2108 head). The production of ground nuts, the main article of export, exceeded, in 1912, by 20,000 tons, that of 1911. The Dakar-Saint-Louis Railway has a development of 264½ kilometers, nearly all in the Cayor region. Since the pacification of Cayor, this region has become the principal field for ground-nut cultivation. A line, whose ultimate destination is Kayes, is in operation from Thies to Guinguineo. Construction as far as Koulougadougou was to be completed by the end of 1914. Vessels entered in the 1911 trade, 943, of 2,009,078 tons; cleared, 950, of 2,004,087 tons. See FRENCH WEST AFRICA.

SERUM THERAPY. Bodenheimer treated a severe case of purpura hemorrhagica with horse serum with a successful result. Ten cc. of serum were administered intramuscularly. In addition, calcium lactate, gelatin, and orange juice were given by mouth. The gangrenous hemorrhagic blisters healed within 48 hours. The action of the serum in this respect resembles that of antitoxin on a diphtheritic membrane. Another dose of the serum sufficed to stop epistaxis and bleeding from the bowel. A discovery by Marie and Leri of certain peculiarities in the serum from subjects of cerebral hemorrhage, makes it probable that another method of diagnosis of internal hemorrhage may be possible. The investigators noticed that certain serums were greenish and more or less fluorescent, and found in each case that the serum came from a patient with cerebral or meningeal hemorrhage. In three other patients with symptoms suggesting cerebral hemorrhage, there was no greenish tint to the serum, as also with serum from a hundred patients without hemorrhage. It was noted, in some cases, on the day the hemorrhage occurred, and it persisted in some up to the fifth or seventh day. This chromoserodiagnosis may apply to internal hemorrhage at any point. See ANTITOXIN.

SERVIA. One of the Balkan States; a constitutional monarchy of southern Europe—previous to 1878 an autonomous Turkish dependency. Capital, Belgrade.

AREA AND POPULATION. In the following table the area of Servia, previous to the wars in the Balkans, is given by departments, with the population returned by the census of Dec. 31, 1910:

Depts.	Sq. km.	1910
Belgrade *	12	89,876
Belgrade	2,025	155,815
Kragujevac	2,295	189,025
Krajina	2,909	112,142
Krushevats	2,710	167,871
Morava	2,900	208,688
Nish	2,553	198,768
Ushitse	3,283	146,768
Pirot	2,419	112,314
Podrinje	3,851	288,275
Pozharevats	4,157	259,906
Rudnik	1,569	85,840
Smederivo	1,277	148,216
Chachak	8,798	188,911
Timok	8,196	149,588
Toplitza	2,889	110,218
Valjevo	2,458	157,648
Vranja	4,842	252,987
Total	48,808	2,911,701
* City.		

By the terms of the treaty of Bucharest (July 25, 1913), Servia gained, as the result of the wars in the Balkans, the eastern part of Novibazar, Kossovo, and central Macedonia. The new territories have an area estimated at 39,000 square kilometers, and are composed of the following territories: Bitolj, with 345,759 inhabitants; Ishtib, unknown; Debar, 82,476; Kavadar, 97,763; Kumanovo, 166,939; Novibazar, 133,401; Plevlye, 62,601; Prishtina, 239,386; Prizren, 227,425; Skoplje (Uskub), 153,293; Tetovo, 157,249. The Greco-Servian frontier has been agreed upon between the two governments, but no protocol defining it had been published in 1914. The Serbo-Montenegrin frontier has been defined.

Of the total population in 1910, 2,528,819 were rural and 382,882 urban. Servian subjects numbered 2,890,602, and of the 21,086 foreigners, 5518 were Hungarians, 6060 Turks, and 6606 Austrians. Servian subjects, speaking Servian, numbered 2,778,706; Servian and Rumanian, 32,556; German, 7494; Albanian, 2151; Hungarian, 1956, etc. Engaged in agriculture were 2,093,947; in other primary production, 6640; in the industries, 166,599; in commerce, 109,998; and in public offices or the professions, 116,566. There were 13,289 marriages in 1912, 114,257 births, and 63,358 deaths. The principal towns, with their population in 1911, are Belgrade, 90,890; Nish, 24,949; Kragujevac, 18,452; Leskovats, 14,266; Pozharevats, 13,411; Vranja, 11,439; Pirot, 10,737. Bitolj (Monastir) had, in 1910, a population of 59,856; Skoplje (Uskub), 47,384; Philip (Perlepe), 21,783; Prizren, 21,244; Prishtina, 18,174.

Primary education is free, State-aided, and nominally compulsory, but attendance does not exceed 25 per cent of the school population. Special schools are few.

PRODUCTION. Servia is essentially an agricultural country, and stock raising is the most important occupation of the people. Of the total area (1904), 1,865,392 hectares were under cultivation, and 1,546,000 under forests. Cereals, plums in large quantities, and vines are grown. No returns for area and production of main crops are available since the wars in the Balkans. There were 965,208 cattle in the country, Dec. 31, 1910, 3,808,815 sheep, 152,617 horses, 836,544 swine, and 627,427 goats. The mineral resources include coal and lignite, copper ore, and gold. The manufactures include milling, brewing, distilling, sugar refining, carpet weaving, and meat packing.

COMMERCE, ETC. No trade statistics are available later than 1911, in which year the imports were valued at 115,425,000 dinars, and the exports at 116,916,000 dinars. The principal articles by great classes, in the 1911 trade, are given below, in thousands of dinars:

	Imports	Exports
Agricultural products	22,769	108,776
Metals	20,804	9,657
Minerals	6,986	718
Drugs, etc.	7,578	288
Textiles, etc.	81,416	2,143
Hides, etc.	4,575	87
Luxuries	2,809	66
Paper	2,518	28
Stone, etc.	1,619	132
Glassware	1,520
Machinery	12,850	28
Other merchandise	1,041	48
Total 1911	115,425	116,916
Total 1910	84,697	98,888
Total 1909	75,535	92,982

By countries of origin and destination, the trade for 1911 is given below, in thousands of dinars:

	Impe.	Exps.		Impe.	Exps.
Austria ..	47,448	48,438	Italy	4,861	4,894
Bosnia ..	220	112	Swits. ..	1,552	258
Bulgaria ..	697	2,802	France ..	5,746	3,841

Russia ..	3,891	58	Other ...	743	17
Germany. .	31,347	28,938			
			Total ..	115,425	116,916

COMMUNICATIONS. The navigable rivers are the Save, the Danube, and the Drina. At the end of 1913 there were in operation 555 kilometers of standard and 414 of narrow gauge railway; in the acquired territory, 387 kilometers of standard gauge, 111 local line, and 105 industrial line. There were under construction 344 kilometers. Telegraph lines in 1912, 4403 kilometers, with 8355 kilometers of wires; State telegraph stations, 211. Post offices, 1556.

ARMY. The Servian army, which, prior to the annexation crisis of 1908-09, was a militia of indifferent quality, made enormous progress in organization and training, and in the two Balkan Wars rendered a good account of itself, going through these struggles with a reputation for military efficiency and fighting form; and its strength in numbers, training, armament, organization, leadership, and readiness for conflict made it a serious consideration in any great struggle in which it might be involved. The army was organized on a basis of compulsory service, and its war strength in 1914 was estimated in round numbers by a competent German authority at 230,000 men, which with the addition of the landsturm could be augmented to a possible 400,000 men in the field. The Servian army was made up of three classes, the regular army, the reserves, and the landsturm, the two former making up the field army, while the landsturm was used only for national defense. Before the annexation of Turkish territory the field army consisted of five divisions of 200,000 men ready for war, the divisions being located as follows: First division at Nish; second division at Valjevo; third division at Belgrade; fourth division at Kragujevac; fifth division at Zajecar. The new territory involved the organization of five new divisions of cadres, which were duly formed. These new divisions

were located as follows: Sixth division at Novibazar; seventh division at Prishtina; eighth division at Uskub; ninth division at Ishtib; tenth division at Monastir; and one cavalry division.

In peace the reserve division had no cadres, but it was shown in the Balkan War that these men could be made fit for service with remarkable rapidity. The Servian infantry is armed with a 7-millimeter repeating Mauser rifle. The ammunition pouches carry 170 pounds, and 30 rounds more per man are carried by draft animals, and 100 rounds in the division ammunition park. The artillery of the field army has Schneider-Crucesot and modern quick-firing guns, while the landsturm has the old De Bange guns of the 85 type.

FINANCE AND GOVERNMENT. The dinar, worth 19.295 cents, is the monetary unit. No official statistics for revenue and expenditure are at present available. The budget for 1913 was reported to balance at 130,764,713 dinars. The debt stood Jan. 1, 1913, at 654,050,500 dinars.

The King is the executive, acting through a council of eight responsible ministers. The legislative power resides in the unicameral national assembly (Narodna-Skupstina) of 160 deputies popularly elected. Reigning monarch, Peter I (Kara-Georgevitch), born 1844, elected to the throne June 15, 1903. Heir-apparent, Prince Alexander, born 1888. The ministry, constituted Sept. 12, 1912, and Sept. 1, 1913, was composed as follows: N. P. Pashitch, Premier and Minister for Foreign Affairs; Dr. L. Patchou, finance; S. M. Protitch, interior; Col. D. Stefanovitch, war; L. Yovanovitch, public instruction; M. Diouritchitch, justice; Dr. V. Yankovitch, commerce, etc.; I. P. Ivanovitch, public works.

HISTORY. In January Col. Dushan Stefanovitch, formerly military attaché at Bucharest, was brought into the cabinet of which Nicholas Pashitch was Premier. When the Servian Parliament was reopened after the Easter recess a bitter controversy arose regarding the relations between the military and the civil power, resulting in the resignation of the Minister of War, the pensioning of two generals (one of whom was the leader of the conspiracy of 1903), and the appointment of a commission to investigate the Officers' Coöperative Society. This unfortunate quarrel was the consequence of the fresh prestige and the intolerable arrogance with which the military clique emerged from the second Balkan War. The rancorous dispute as to whether military or civil authorities should take precedence was seized upon by the Opposition in Parliament as an excuse for moving a resolution of no confidence in the government, but the Opposition could muster only 50 votes against the 77 ministerial supporters. Feeling continued to run high, however, and on May 20 the sitting almost degenerated into a riot. On the following day the Opposition deputies quit the house in a body, and continued to absent themselves; while the remainder of the house busied itself with several important projects—among them a credit of \$24,500,000 for military expenditure, to be spread over the three years 1914-15-16. Finally, however, the combined opposition of the Progressive, Nationalist, and Samostalni groups succeeded in overthrowing the Pashitch ministry. The combined Opposition was not closely enough united to support a ministry from its own side of the house and as

a result the King recalled Nicholas Pashitch. Returning again to power, M. Pashitch arrived at a tactful solution of the dispute between military and civil authorities. In June he announced a dissolution of Parliament and called new elections for August 14. The new Parliament was to have assembled on September 23. On June 24 the aged King Peter was forced by ill-health temporarily to resign the government into the hands of Crown Prince Alexander as Regent; and while King Peter was enjoying the mineral baths at Vrania, many journals were predicting his speedy abdication. But very soon the press was furnished with a more substantial topic for discussion. The murder of the Austrian heir-apparent at Sarajevo, the imputation of Servian complicity in the crime, the Austro-Hungarian ultimatum to Servia, and the declaration of war on July 28, led swiftly to the awful catastrophe of a general European war. These events, and the part which Servia played in the war, will be found fully described in the article on the WAR OF THE NATIONS. The removal of the Servian capital at the beginning of the war from beleaguered Belgrade to Nish, and the British loan of \$4,000,000 to Servia without interest until the end of the war, may be mentioned here because of their importance in the internal history of Servia. Some attention is also due to the concordat which was signed in June by the Servian ambassador in Paris and Cardinal Merry del Val, papal Secretary of State, whereby the Austrian protectorate over the Catholics in Servia was ended, and an Archbishop of Belgrade was entrusted with the protection of Roman Catholic interests in Servia, while a bishop with his see at Skolpje was given jurisdiction over New Servia. When it is remembered that Austria-Hungary, and especially the Archduke Francis Ferdinand, had for many years regarded the Hapsburg monarchy as the defender and champion of Catholicism against the Orthodox States of southeastern Europe, the significance of the concordat becomes clearer. One other occurrence remains to be noted: the resignation of M. Pashitch late in November and his second reinstatement as Premier. See also the articles on GREECE and TURKEY.

SEVENTH DAY GERMAN BRETHREN. See BRETHREN, CHURCH OF THE.

SEWAGE PURIFICATION. Imhoff or Em-scher settling tanks (really an improved two-story type of settling tank), combined with sprinkling or percolating filters where further treatment is necessary, continued to be the most generally accepted method of sewage treatment. Where still more treatment is demanded the sprinkling filter effluent may be either applied to intermittent sand filters or disinfected with hypochlorite of lime (bleaching powder) or with liquid chlorine (compressed chlorine gas). In Germany fine screening was widely used for partial clarification. It was projected for several American cities in 1914. The indications were that future fine screening was to be adopted by a number of American cities where a large volume of diluting water was available and offense to the eye was to be avoided and dangers to bathing beaches or water-supplies lessened. Where the full protection of public water-supplies is sought reliance must be placed

on water purification, even if sewage treatment is practiced.

Scores of sewage purification works were built or put under construction during the year, widely distributed over the whole North American continent. The third and final installment of Imhoff tanks and sprinkling filters was completed for Atlanta, Ga.; the construction of a large number of Imhoff tanks to extend the sewage works of Baltimore was begun; plans were about completed and some construction work started for three plants to treat the sewage of Cleveland, Ohio, and there was much other sewage-works activity in Ohio. A large experimental sewage-treatment plant was being operated at Brooklyn, N. Y., small ones at Erie, Pa., and Indianapolis, and Milwaukee also installed an experimental plant. The final report of the Metropolitan Sewage Commission of New York, containing recommendations much as outlined in the 1913 YEAR BOOK, was published early in 1914, and the records and projected plans of the commission were turned over to a committee of the Board of Estimate and to the borough consulting engineers for further study.

Early in the year many data, gathered by sanitary experts from both countries, on the pollution of the boundary waters of the United States and Canada were published by the International Joint Commission. Later in the year these and other sanitary experts submitted a tentative report interpreting the bearing of the data on the sewage disposal and water purification problems of the cities of the Great Lakes. As regards sewage disposal the experts stated that in waters where some pollution is unavoidable, sewage disposal by dilution is permissible, if nuisance is prevented, and if no undue burden is placed on water-purification plants (see WATER PURIFICATION). The method of sewage treatment should be varied to suit local conditions. In general, the simplest allowable means would be $\frac{1}{4}$ -inch mesh screens in sedimentation. As a rule no more treatment should be required than fine screening or sedimentation, or both, followed by chemical disinfection.

SEWERAGE. A remarkable example of deficient sewerage facilities and of inadequate records of such sewers as existed was disclosed in an exhaustive report on sewerage and sewage disposal made for Cincinnati, Ohio, during the year. Extensive and costly topographic and underground surveys were reported on and recommendations offered for comprehensive extensions to the sewerage system. Tentative sewage-treatment projects were also presented. A 150,000-gallon electric-driven sewage pump plant was being built for Boston. To lessen the leakage or infiltration of ground water into sewers, the use of bituminous compounds instead of Portland cement mortar was gradually increasing. The growing number of explosions in sewers, attributed largely to gasoline from garages, led to a number of investigations and to systematic inspections and preventative regulations in a number of cities. Consult vol. i of Metcalf and Eddy's *American Sewerage Practice* (New York), the first installment of a projected three-volume work on sewerage and sewage disposal. See also SEWAGE PURIFICATION.

SEX HYGIENE. See HYGIENE.

SGAMBATI, GIOVANNI. An Italian pianist and composer, died in December, 1914. He was born in Rome, May 28, 1843, and studied in that

city under Barbieri, Natalucci, Aldega, and Liszt. He composed a pianoforte quartet (first heard in 1866), which established his reputation throughout Italy and Germany. In 1877 he was appointed professor of pianoforte at the Academy of Santa Cecilia, Rome. In 1896 he founded the Nuova Società Musicale Romana. His compositions include a *Requiem Mass* (1896); *Symphony in D; Concerto in G Minor; Two Quintets with the Piano*; and other symphonies, overtures, concertos, and also pieces for the organ. Sgambati greatly admired Wagner, and his own work is somewhat Germanic in character.

SHACKLETON'S EXPEDITION (THE IMPERIAL TRANSANTARCTIC EXPEDITION). See POLAR RESEARCH, *Antarctic*.

SHALLENBERGER, WILLIAM SHADRACH. Former member of Congress from Pennsylvania, died April 15, 1914. He was born in Mt. Pleasant, Pa., in 1839, was educated in the schools of that town and at Lewisburg University. He served as first lieutenant and adjutant in the 140th Pennsylvania Volunteers from 1862 to 1864, and was wounded at Gettysburg and at Todd's Tavern. From 1877 to 1883 he was a member of Congress from the Twenty-fourth Pennsylvania District. From 1897 to 1907 he was assistant postmaster-general.

SHEEP. See STOCK RAISING.

SHELBY, DAVID DAVIE. American jurist, died Aug. 22, 1914. He was born in Madison Co., Ala., in 1847, and studied law at Cumberland University. In 1870 he was admitted to the bar and until 1899 practiced at Huntsville, Ala. He was a member of the State Senate from 1842 to 1844, and in 1889 he was appointed United States Circuit Judge for the Fifth Judicial District.

SHELDON, ANDREW FLINT. An American physician and soldier, died Jan. 4, 1914. He was born in Huron, Wayne Co., N. Y., in 1831, and graduated from the University of New York in 1852. He practiced medicine at Lyons, N. Y., until the outbreak of the Civil War, when he was appointed assistant surgeon of the Seventh New York Cavalry. He served with this and other regiments throughout the war, acting for a time as executive officer in the medical director's office at Washington. He was subsequently commissioned by President Lincoln as surgeon of the United States Volunteers, and after twenty months' service was placed in charge of the Campbell United States General Hospital at Washington, where he remained until he was mustered out of service in August, 1865. He was commissioned lieutenant-colonel by President Johnson for meritorious services. After the war he returned to his native home where he practiced until within two years of his death. He invented a field hospital tent which was adopted throughout the service.

SHERMAN, SAMUEL STERLING. An American educator, died Nov. 23, 1914. He was born in Vermont in 1816, and graduated from Middlebury College. At the time of his death he was the oldest college alumnus in the United States. For several years before the Civil War he was president of Howard College, now in Birmingham, Ala., and the Judson College for Girls, now in Marion, Ala. During the Civil War he was president of Milwaukee College, now known as Milwaukee Downer College. He removed to

Chicago in 1878 and was a resident of that city for the remainder of his life.

SHIPBUILDING. Shipbuilding, as well as ships and shipping generally, was an important topic in the year 1914, on account of the great European War in which commercial as well as military supremacy was involved. Whether Great Britain should continue to rule the seas and Germany be halted in her progress towards a vast mercantile marine were not the least of the questions at issue. Many merchant ships were under construction, though naturally the amount of construction varied in the various countries. The conditions of the war soon established the fact that Germany, Belgium, and Austria-Hungary were struck from the shipbuilding trade, while the United States in its effort to secure shipping of its own under the American flag was handicapped by the various conditions involved in its statutes and the general state of its shipping as well as uncertainty and lack of precedent under international law. Never before was so much interest paid to shipbuilding and shipping. While some impetus had been given to American shipping by the construction of the Panama Canal, nevertheless it was in view of the war and the internment of German and Austrian ships in various ports that the question was brought forcibly before the American people, as their commerce was vitally concerned.

Looked at from the world's standpoint the shipbuilding industry in Great Britain was in good condition, although costs of production were extremely high, and rapidity of workmanship was called for both by the government and private owners. Nevertheless, the industry proceeded with the coöperation of labor unions and shipbuilders, and while numbers of workmen were called into the military service yet the labor unions withdrew all restriction on labor, granting permission to work overtime to any extent, and to shift from yard to yard in accordance with the emergencies on the most pressing naval work. Furthermore, private yards working on naval contracts were enabled to draw workers from mercantile yards whenever they required them, and an extraordinary degree of elasticity in shipyard and engine-shop labor was manifested, so that greater progress was made on present naval work than would have been possible in times of peace.

Germany launched in 1914 a larger tonnage than did the Clyde, and if there had been no war it is hard to say to what extent the German mercantile marine would have been augmented. Nearly 200 vessels of over half a million tons displacement were launched. In France the work of the shipyards was interfered with, as many workers were being called to the military service. In Austria-Hungary very little work was done, and the British engineers, who had assisted in the newer plants, left the country. In Belgium after the war began the shipyards and engine shops were being used by the Germans for the manufacture of munitions of war.

Lloyd's Register of Shipping in its annual return of shipbuilding throughout the world during the year 1914, for obvious reasons does not give the warship work done in the European countries, and consequently the figures deal exclusively with merchant work.

TABLE FROM LLOYD'S REGISTER OF SHIPPING, SHOWING THE NUMBER AND TONNAGE OF VESSELS OF 100 TONS GROSS AND UPWARDS (EXCLUDING WARSHIPS) LAUNCHED IN THE VARIOUS COUNTRIES OF THE WORLD DURING THE YEARS 1910-1914

Year	United Kingdom tons	British Colonies tons	Austria-Hungary tons	Denmark tons	France tons	Germany tons	Holland tons
1910	1,143,169	26,848	14,804	12,154	80,751	159,303	70,945
1911	1,803,844	19,662	87,836	18,689	125,472	255,532	93,050
1912	1,738,514	34,790	88,821	26,108	110,784	375,317	99,489
1913	1,932,153	48,389	61,757	40,932	176,095	465,226	104,296
1914	1,683,553	47,534	34,335	32,815	114,052	387,192	118,158

Year	Italy tons	Japan tons	Norway tons	United States tons	Other Countries tons	No.	Totals tons
1910	23,019	30,215	36,931	331,318	29,401	1277	1,957,853
1911	17,401	44,359	35,435	171,569	27,291	1599	2,650,140
1912	25,196	57,755	50,255	234,223	60,622	1719	2,901,769
1913	50,356	64,664	50,637	276,448	61,979	1750	3,332,882
1914	42,981	85,861	54,204	200,762	51,311	1319*	2,852,753

* This table does not include particulars of vessels of less than 100 tons gross; and takes into account only vessels that were launched in 1914, whether they were completed during the year or are still under construction. On account of the war, it is impossible to give full figures for the whole of the year 1914 in respect of several countries; for the same reason warship tonnage has been excluded throughout this summary.

The following table (from *Engineering*, London) shows the notably large merchant steamers launched during the year in British yards.

Name	Tons	I. H. P.	Builder of Vessel
White Star liner <i>Britannic</i>	50,000	60,000†	Harland and Wolff
Holland-American <i>Statendam</i>	33,000	20,800†	Ditto
Red Star liner <i>Belgenland</i>	27,000	18,400†	Ditto
Royal Mail Steam Navigation Company's <i>Almazora</i>	15,600	12,150†	Ditto
Pacific Steam Navigation liner <i>Orbita</i>	15,500	11,840†	Ditto
Aberdeen liner <i>Euripides</i>	14,947	8,270†	Ditto
Anchor liner <i>Transylvania</i>	14,315	12,000*	Scott's Shipbuilding and Engineering Co.
Anchor liner <i>Tuscantia</i>	14,300	12,000*	Alex. Stephen and Co.
Canadian Pacific liners— <i>Metagama</i>	13,000	10,500	Barclay, Curle and Co., Limited.
<i>Misanobie</i>	12,469	10,500	
P. and O. liner <i>Kaiser</i>	11,430	14,000	Caird and Co., Limited.
Eagle Oil Transport Company's <i>San Nazario</i>	10,064	4,100	Wm. Duxford and Son.

* Geared turbines.
† Combination—four-cylinder piston engines and low-pressure turbine.

The following table from *Engineering*, London, gives the aggregates of production in the United Kingdom in the years 1914 and 1913.

	1914 † Tons	1913 Tons
Power-driven tonnage *	1,709,900	2,205,400
Sailing tonnage	27,800	81,600
Totals	1,737,700	2,287,000
His Majesty's Dockyards	74,960	
Grand totals	1,737,700	2,311,960
Foreign-owned tonnage	854,500	507,000
Per cent of total	20.45	22
Total merchant tonnage	1,737,700	2,042,760
Per cent of power-driven merchant tonnage to total merchant tonnage	99.85	99.35
Horse-power of engines	1,473,300	2,679,000
Per cent of all naval tonnage to merchant tonnage		13.3

* Includes warships in private yards in 1913.

† Figures for 1914 do not include warship tonnage or engine power on account of the war and the suppression of military information.

From the following table it will be seen that the merchant marine of the United States on June 30, 1914, including all kinds of documented ships numbered 26,943 vessels of 7,928,688 gross tons, as compared with 27,070 vessels of 7,886,518 gross tons on June 30, 1913.

COMPARISON OF MERCHANT MARINE OF 1913 AND 1914

SHIPBUILDING IN THE UNITED STATES. The amount of tonnage turned out by shipbuilders in the United States in 1914 was considerably less than in the previous year, though with exceptions in favor of certain yards on the Great Lakes, and on the Pacific coast. The construction of both merchant and naval ships of the largest builders is shown in the accompanying tables, which give the comparative rank of the leading shipbuilders.

TABLE I.—MERCHANT CONSTRUCTION
No. Gross Tons I. H. P.

Newport News Shipbuilding and Dry Dock Co.	5	31,987	15,500
Maryland Steel Co.	9	25,045	12,890
New York Shipbuilding Co.	8	20,809	9,500
American Shipbuilding Co.	4	19,857	6,084
Great Lakes Engineering Works	9	19,598	7,875
Union Iron Works	8	14,072	5,200
Fore River Shipbuilding Corporation	2	11,196	4,200
American Car & Foundry Co.	16	10,451
Harlan & Hollingsworth Corporation	5	5,524	4,540

Detroit Shipbuilding Co.	1	2,072	1,000
Johnston Bros.	5	1,071	580

TABLE II.—NAVAL CONSTRUCTION

	No.	Tons Displacement	I.H.P.
Fore River Shipbuilding Corporation	5	30,993	46,800
Wm. Cramp & Sons' Ship & Engine Building Co.	4	4,037	33,950
New York Shipbuilding Co.	1	2,600	9,000
Seattle Construction & Dry Dock Co.	4	2,146	3,350
Bath Iron Works	1	1,010	16,000

The largest vessel completed at the Fore River yard was the battleship *Nevada*, of 27,500 tons displacement and 26,500 indicated horsepower, while other naval work included a destroyer, the submarine tender *Fulton*, and two submarines, both the submarine tender and the submarines being fitted with Diesel engines. The engine for the *Fulton* was of about 1000 horsepower and was the largest single Diesel engine so far installed in an American ship. The merchant work turned out by the Fore River yard consisted of the freight steamers *Atlantic* and *Pacific*. The merchant tonnage of the Newport News Shipbuilding & Dry Dock Co. included the bulk oil freight steamers *John D. Archbold* and *John D. Rockefeller*, the Mallory freight steamships *Neches* and *Medina*, and the collier *Edward Pierce*. The work on hand included the battleships *Pennsylvania* and *Mississippi* and two revenue cutters.

At the Maryland Steel Company, Sparrows Point, Md., the last three of the American-

Hawaiian Steamship Company's freight steamers, the *Washingtonian*, *Iowan*, *Ohioian*, of 6649 gross tons each, were completed during the year. There were under construction at the Maryland Steel Company's yard two colliers for the Panama Canal, of 10,650 gross tons and 7200 indicated horsepower each.

The New York Shipbuilding Company, Camden, N. J., during the year delivered two large oil steamers of 5188 gross tons and 2650 indicated horsepower each for the Gulf Refining Company; the collier *Hampden*, of 4725 gross tons and 2100 indicated horsepower, for the Coastwise Steamship Company; the municipal ferry *Mayor Gaynor*, of 1834 gross tons, for New York City, and four car floats for railway service. The output also included a protected cruiser of 2800 tons displacement, fitted with Thornycroft boilers and Parsons turbines, for the Greek government. The work in hand at the end of the year included the Argentine battleship *Moreno*, of 27,630 tons and 49,300 horsepower, equipped with Curtis turbines; the United States battleships *Oklahoma*, of 27,500 tons and 26,240 indicated horsepower, and the *Idaho*, of 32,000 tons and 37,000 horsepower. The former is propelled by reciprocating engines and the latter by Parsons turbines. There were also four destroyers and the destroyer tender *Melville*. Two large merchant vessels were also under construction, one of which is an oil tanker for the Gulf Refining Company, which is a duplicate of the two delivered; and the lumber steamer *William O'Brien*, of 5528 gross tons and 2000 horsepower.

The total output from the Jackson & Sharp plant of the American Car & Foundry Company, at Wilmington, Del., amounted to 10,451 tons, which is considerably in excess of the output from any other wooden shipyard in the United States. The tonnage consisted principally of seagoing barges, car ferries, and dump scows.

The Harlan & Hollingsworth Corporation, Wilmington, Del., built the coastwise oil or lumber steamer *Francis Hanify*, of 2588 gross tons and 1720 indicated horsepower, and several excursion and ferry-boats.

William Cramp & Sons' Ship & Engine Building Company, Philadelphia, Pa., completed several naval vessels, including one submarine, two destroyers, and the gunboat *Sacramento*, and at the end of the year had under construction the two turbine passenger ships *Great Northern* and *Northern Pacific*, of 8255 gross tons and 25,000 horsepower, the car ferry *Henry M. Flagler*, for the Florida East Coast Railway, and five destroyers for the United States navy.

SHIPBUILDING ON THE GREAT LAKES. Outside of the work of the American Shipbuilding Company and the Great Lakes Engineering Company comparatively little construction was undertaken on the Great Lakes. The vessels built by the American Shipbuilding Company included the bulk freighter *Howard M. Hannah, Jr.*, of 6204 gross tons and 1760 horsepower, built at Cleveland; the bulk freighter *Robert L. Ireland*, of 6387 gross tons and 1600 horsepower; and the bulk freighter *William D. Crawford*, of 6385 gross tons and 1800 horsepower. The Great Lakes Engineering Works built the passenger steamer *South American*, of 2662 gross tons and 2500 horsepower, for the Chicago, Duluth, & Georgian Bay Transit Company; a bulk freighter of 6311 gross tons and

SHIPPING

HAMBURG-AMERICAN LINE STEAMSHIP "VATERLAND"
THE WORLD'S LARGEST STEAMSHIP, 1914

1800 horsepower, a lumber steamer of 1815 gross tons and 700 horsepower, and a special type of self-unloading freighter, the *Huron*, of 4810 gross tons and 1775 horsepower, for the Wyandotte Transportation Company.

The greatest output of the yards on the Pacific coast was by the Union Iron Works, San Francisco, Cal., which built two large oil tankers, the *Frank H. Buck* and *Lyman Stewart*, both of 6076 gross tons and 2600 horsepower, the former for the Associated Oil Company and the latter for the Union Oil Company. The Union Iron Works had under construction for the Standard Oil Company an oil tank steamer of 6000 gross tons and 2600 horsepower.

The Seattle Construction & Dry Dock Company, Seattle, Wash., had some minor work including submarines and the submarine tender *Bushnell*, of 2500 gross tons and 2500 horsepower, fitted with Yarrow watertube boilers and geared turbines, and building for the United States government.

Statement of vessels built in the United States and officially numbered during the calendar year, 1914:

Wood	No.	Tonnage
Sail	41	7,085
Steam	769	80,155
Unrigged	248	58,128
Total	1,058	90,868
Metal		
Sail	5	1,762

NAVY YARDS. A greater amount of shipbuilding work was in progress in 1914 in the United States navy yards than ever before. The Secretary of the Navy authorized new construction work at three navy yards which hitherto had not undertaken the construction of vessels since the days of steel. Ship construction in addition to being carried out at the New York Navy Yard, Brooklyn, N. Y., and at the Mare Island Navy Yard, San Francisco, Cal., was to be extended to other yards and besides the battleships *Arizona* and *California* which were being built at the New York Navy Yard, the fuel ships *Kanao* and *Maumee*, building at Mare Island Yard, work was begun on the construction of a submarine at the Portsmouth Navy Yard, Portsmouth, N. H., on the supply ship No. 1, at the Boston Navy Yard, and on the transport No. 1, at the League Island Navy Yard, Philadelphia, Pa. The necessity for installing new machinery and equipment delayed the construction on these vessels, however, for over a year.

On the recommendation of Rear Admiral R. S. Griffin, engineer-in-chief of the United States navy, the Secretary of the Navy, Daniels, authorized the installation of a steam turbine electric propelling plant on the superdreadnought *California*, which was to be built at the Brooklyn Navy Yard. A test of this type of power plant was made on the collier *Jupiter*, the first deep-sea vessel of any type to be fitted with electric

motors, and the *California* will be the first electrically-driven warship ever built.

VATERLAND. The *Vaterland* which exceeded the *Imperator* by 41 feet in length and 2 feet in beam and in displacement by no less than 600 tons, was the world's largest steamship, and made its maiden voyage from Hamburg to New York in May. The *Vaterland* was 950 feet in length, 100 feet in beam, and displaced 54,282 tons. She was built as a 23-knot ship, but on her trial trip averaged a speed of 25.8 knots, and resembled the *Imperator* in many respects. The *Vaterland* was built with both longitudinal and transverse bulkheads, the former serving as inner walls of the coal bunkers and acting as an inner skin. Her main dining-room will accommodate 800 people and the ship has a maximum capacity of 5300 persons. It is driven by four screw propellers geared to four steam turbines, and there is a total bottom triple section extending well above the water line. The *Vaterland* on account of its size is unable to pass through the locks of the Panama Canal, which are but 100 feet in width. On her arrival in New York City, May 21, over 40 tugs were required to dock the steamer, on account of the tide and interference by a tug and tow. The *Imperator* returned to Germany, leaving the *Vaterland* interned at Hoboken after the beginning of the war. The Hamburg-American Line launched during the year the third of the famous trio of large ships which was christened the *Bismarck* by the German Emperor. This liner was 955 feet in length, 100 feet in beam, and 60,000 tons displacement, being designed to maintain an average speed of 25.3 knots. Like the *Vaterland* she was to be driven by turbines operating on four shafts.

AQUITANIA. A notable vessel of the year which was put into service, and had a brief passenger career, as it was taken early in the war by the Admiralty for a transport or merchant cruiser, was the Cunard liner, *Aquitania*. This vessel launched in April, 1913, was notable for its machinery, having a turbine working in triple series with a great range of expansion for steam so as to secure greater economy. The *Aquitania* had a quadruple screw, triple expansion turbine, was 865 feet in length, 97 feet in breadth, 64 feet 6 inches in depth, had an indicated horsepower of 56,000, and a sea speed of 23 knots. It had a displacement of 49,430 tons and a gross tonnage of 46,150 and a net tonnage of 17,500. It would carry 6000 tons of coal in permanent bunkers, and its passenger capacity was 618 first-class, 614 second-class, 1998 third-class, in addition to a crew of 972 persons, making a total carrying capacity of 4202. In addition to its representing the latest possible developments for transatlantic service, being designed to operate in connection with the *Lusitania* and the *Mauretania* to maintain a weekly passenger service across the Atlantic, the *Aquitania* was designed for possible naval service, with positions on the deck specially strengthened for carrying concealed pedestal mountings for a large number of quick-firing guns, there being two such gun positions amidships on the port and starboard sides, on the bridge deck, and aft on the poop, while on the forecastle there were two gun positions on each side of the ship and on the same deck two similar positions on each side so that 12 guns were provided for.

The Cunard liner, *Transylvania*, went into

service during the year and marked the first application of the geared turbine to Atlantic service, though this device had been tried previously on ships of comparatively small size. The *Transylvania* displaced 19,400 tons, was 567 feet over-all, by 66 feet 3 inches molded width, and carried 305 first-class and 216 second-class passengers and 858 third-class passengers. She was equipped with two sets of Parsons turbines, giving a joint total shaft horsepower of 9000, and driving the ship at 15½ knots. The propellers ran at 120 revolutions per minute, and the gear reduction mechanism produced this speed from a revolution of the turbines 12½ times as fast.

SHIP REGISTRY ACT OF AUG. 18, 1914. An important step was taken on Aug. 18, 1914, brought about by the outbreak of the European War, when it was realized that the legislation in the United States embarrassed the citizens of the United States who own property at sea, inasmuch as they had been forced to employ other flags and registers which conformed to statutes, but not to actual ownership. From the date of the first Registry Act of September, 1789, American registry was confined to ships built in the United States, and Congress at the outset passed legislation providing that only documented ships could engage in the trade of the United States and divided these documented ships into three classes; first, registry for general purposes of trade and obligatory on foreign ships; second, enrollment for vessels in the coasting trade; and third, the annual license of a vessel for a year to engage in the coast trade or in the fisheries respectively. Foreign-built vessels owned by Americans could not carry on sea commerce or engage in any form of trade except under prohibitory penalties, and as a result of this policy and the fact that modern steel ships for some years could be built more cheaply abroad than in the United States, American capital desiring to invest in shipping had purchased abroad and operated its ships under other flags. They were prohibited from trading with the United States under the American flag though they were free to do so with all other parts of the world. For many years for-

eign-built ships representing American capital but under foreign flags were nearly equal in tonnage to ships registered under the American flag for foreign trade and had even greater carrying power. It was not until the Panama Canal Act of Aug. 24, 1912, that any effort was made to repeal the law which provided that for admission to American registry for foreign trade and trade with the Philippines, Guam, and Tutuila, foreign-built vessels certified by steamboat inspection service, as safe to carry dry and perishable cargo, not more than five years old at the time of registration, could be admitted. In March, 1914, the Secretary of Commerce recommended that the five-year age limit be repealed and a bill to that effect was introduced in Congress, but it was not until the outbreak of the European War that an act was passed which brought about this change of policy and enabled American owners to use their own property at sea under the American flag. In this act certain discretionary powers were given to the President to suspend the requirements as to the American citizenship of watch officers and the survey inspection and measurement by United States officers of foreign-built vessels so admitted to registry when the same was demanded by the needs of foreign trade.

Accordingly up to the end of the year (or more exactly up to Jan. 7, 1915) 110 vessels with a total gross tonnage of 395,460 were admitted to American registry. In this number were included ships belonging to the United States Steel Products Company, the Standard Oil Company, the Dollar Steamship Company, W. R. Grace & Co., the Vacuum Oil Company, and other well-known American corporations which previously had sailed under foreign flags. The largest registered was the *Oceana* of the Morse Dry Dock and Repair Company, running between New York and Bermuda.

WORLD'S SHIPPING IN 1914. In the accompanying table are given the number and net and gross tonnage of steam and sailing vessels of over 100 tons, of the several countries of the World, as recorded in *Lloyd's Register* for 1914-15.

Lloyd's Register of Shipping was unable to publish, for the quarter ended December 31, the usual information regarding the shipbuilding industry throughout the world. It was stated that in the United Kingdom at the close of the quarter, of vessels of 100 tons and upwards the construction of which was actually begun, there were, exclusive of warships, 462 vessels of 1,627,316 tons gross under construction. This tonnage under construction was about 96,000 tons less than that which was in hand at the end of September and 329,000 tons less than the total at the end of 1913.

SHOES. See **BOOTS AND SHOES**.

SHOOTING. There were no international rifle shooting matches held in 1914 of any great importance. The national contests of the United States which had formerly been held at a central point also were abandoned, the country being divided into five sections, only three of which held competitions. The team match in District A was won by Massachusetts and in District D by Arizona. The contest in District B was left undecided because of a dispute between the teams taking part. Charles C. Terry of the United States Marine Corps won the individual match in District A with a score of 326. In District B the winner was Sergt. E. E. Walters, Mississippi National Guard, with the same score, and in District D, E. A. Cole, First Kansas Infantry, with 323. The individual pistol matches resulted as follows: District A, Second Lieut. W. B. Loughborough, United States army, 731; District B, Priv. J. E. Crook, Florida National Guard, 567; District D, Quartermaster-Sergt. S. G. McKane, First Kansas Infantry, 683. The intercollegiate indoor championships were won by the Michigan Agricultural College and the outdoor by the Massachusetts Agricultural College.

In trap shooting the Interstate Association's Southwestern Handicap, held at Oklahoma City, Okla., was won by M. D. Dickman of Durant, Okla., with 88 out of the possible 100. Woodfolk Henderson of Lexington, Ky., won the Grand American Handicap, his score being 98 out of a possible 100.

The national amateur championship went to Ralph L. Spotts of the New York Athletic Club with 188 out of a possible 200. Spotts also captured the indoor title for the second succes-

sive year with a total of 97 out of a possible 100.

SHORT BALLOT. See **ELECTORAL REFORM**.

SHREVEPORT CASE. See **RAILWAYS**.

SIAM. An independent kingdom in south-eastern Asia, extending approximately from the sixth to the twentieth degree of north latitude and from the ninety-seventh to the one hundred and sixth degree of east longitude. It is a buffer State between British Burma and French Indo-China. Capital, Bangkok. The total area is estimated at 600,000 square kilometers (198,900 square miles); the population (1910-11) at 8,149,487. Foreigners in the country in 1911, about 2000, of whom 538 Turks, 244 Germans, 218 French, 190 Japanese, 163 Danes, 135 Americans, 123 Italians, 80 Portuguese, 48 English, etc. Births numbered for the year 1910-11 162,491, and deaths, 84,495; Bangkok had 628,675 inhabitants, of whom 197,918 were Chinese. The immigration of Chinese in 1910 was 75,409; in 1911, 71,258; 1912, 68,361. Emigration of Chinese, 1910, 63,007; 1911, 52,562; 1912, 45,986. The national religion is Buddhism. Large educational powers are in the hands of the Buddhist monks.

PRODUCTION AND COMMERCE. The staple product and export is rice, and the area under this grain has been much enlarged by irrigation during recent years. Other crops of some importance are sesame, hemp, cotton, tobacco, pepper, and fruits. Cattle are raised in considerable numbers. The collection of rubber has been begun, and the cutting of teak in Northern Siam is an important industry, chiefly in British hands. Large quantities of fish are taken along the coasts. The only minerals worked on a commercial scale are tin and wolfram. The export of rice in 1912-13 was valued at 65,320,000 ticals (1 tical = 37.085 cents); teak, 5,600,000 ticals. The total imports were valued at 76,225,000 ticals and the exports at 81,971,000 (68,205,000 and 108,910,000 in 1910-11). The United Kingdom contributed imports valued at 20,622 thousand ticals and received exports valued at 3013 thousand ticals; China, 15,286 and 212; British India, 8222 and 2008; Germany, 5668 and 4194; Singapore, 5326 and 36,870; Dutch East Indies, 5959 and 475; Hongkong, 1445 and 25,343; Switzerland, 561 and 13; other countries, 13,136 and 9843. There were entered at the ports in the 1912-13 trade, 664 steamers, of 566,172 tons; cleared, 677, of 569,316. The merchant marine in 1913 included 33 steamers, of 8621 tons, and 45 sail, of 3612. State railways had a length in 1912 of 1024 kilometers (636 miles). Telegraph lines, 9457 kilometers (5876 miles), with 10,628 kilometers (6604 miles) of wires and 152 stations. Post offices, 223.

FINANCE AND GOVERNMENT. In the table below the budget for 1913-14 is detailed in thousands of ticals.

Revenue	1000 t.	Expend.	1000 t.
Customs	6,308	Civil list	7,750
Farms	12,842	Interior	12,048

Other	5,710	Agriculture, etc.	1,272
		Other ordinary	8,787
Total	65,094	Total ordinary	64,599
		Extraordinary	15,228
		Total	79,827

The public debt in 1913 amounted to £5,712,320. The sovereign is the executive, aided by an appointed ministry and a legislative council of (at present) 41 members appointed also by the King. He is in effect an absolute despot. Succession is limited to the prince in blood ranking highest among the King's sons, but he frequently appoints his successor. The present King being without male issue, the succession passes presumptively through the line of the queen-mother's sons, according to their respective ages. The King in 1914 was (Somdet Phra Paramindr) Maha Vajiravudh, born Jan. 1, 1881, proclaimed successor and Crown Prince 1895, and succeeded his father, Chulalongkorn I, to the throne Oct. 23, 1910. He was educated at Oxford and has traveled extensively. The administration and general condition of Siam have been greatly improved in recent years through foreign advisers in various branches of the government.

SICKLES, DANIEL EDGAR. An American soldier, died May 3, 1914. He was born in New York City in 1825 and was educated in New York University. He learned the printer's trade and also studied law, being admitted to the bar in 1846. For the seven years following he practiced law in New York, serving one term in the New York legislature. In 1853 he was corporation attorney for New York City, but resigned to become secretary of legation at London, serving from 1853 to 1855. In 1856 he was elected to the State Senate, serving for one year, and from 1857 to 1861 was member of Congress. In 1859 he shot and killed Philip Barton Key in Washington. Key was the son of the author of the "Star Spangled Banner," and was accused by Sickles of paying offensive attention to the latter's wife. On trial for murder he was acquitted.

At the outbreak of the Civil War, although a Democrat, he at once offered his services to President Lincoln. He had served for many years in the National Guard of New York, and had reached the rank of major. He was authorized by President Lincoln to raise a regiment, and he at once established a camp on Staten Island and began to enlist recruits. The first regiment he raised was composed almost entirely of Democrats. Following this he raised four other regiments, and himself paid the expenses of recruiting and drilling. These five regiments were called the Excelsior Brigade, and Sickles was induced by President Lincoln to take command of it as senior colonel. In September

of 1861 he was appointed brigadier-general, and he succeeded General Hooker in command of a division of the third army corps, leading this division in the battles of Antietam and Fredericksburg. In November, 1862, he was appointed major-general of volunteers and commanded the third corps at Chancellorsville.

His most distinguished service was at the battle of Gettysburg, where on the second day of the battle he was in command of the Union left. On the extreme left and beyond the battle line as first established by General Meade were the Big and Little Round Tops, and in front of General Sickles' troops was the Peach Orchard Ridge. General Sickles decided that if he could gain that ridge he might be able to prevent Longstreet from reaching the Round Tops. Therefore an hour before the battle began, and without awaiting orders, General Sickles took a position in advance of the Federal battle line on Peach Orchard Ridge. The results of this move have been disputed; military experts opposed to it, declare that it endangered the entire Federal army, while supporters of General Sickles declare that his move was largely instrumental in winning the battle. The portion of the battlefield occupied by General Sickles' troops was called the Bloody Angle, and here the fight lasted from 3 o'clock in the afternoon until 7 at night. Half an hour before the fighting ended a shell shattered General Sickles' knee, but he buckled a strap around his leg and remained on his horse until the last shot was fired, the leg being amputated later on the same night. After he had recovered from the wound President Lincoln sent him on an inspection trip through the South and he was with Sherman's army on the march to the sea. After the war he was military governor of the Department of the South, which included North and South Carolina, and from 1866 to 1869 he was Minister to Holland. He then declined an appointment as Minister to Mexico and was sent instead to Spain, where he served until 1873, when he resigned. After the war General Sickles identified himself with the Republican party and he claimed the credit of having first mentioned General Grant as a candidate for President. From 1892 until 1894 he was a member of Congress, and served as sheriff of New York in 1890. In 1902 he was commander of the Medal of Honor Legion. General Sickles' last years were clouded by financial troubles and by sickness. At his death Peter J. Osterhouse and Grenville M. Dodge were the only two living major-generals who had commanded in the Civil War.

SIERRA LEONE. A British colony and protectorate on the west coast of Africa. The colony has a coast line of 210 miles. The protectorate extends to the north and east into the interior. Total area, 32,110 square miles; population, about 1,400,000. The peninsula of Sierra Leone and the land immediately adjoining had a population in 1911, inclusive of Freetown and suburbs, of 75,318. Freetown, the capital, lies about four miles up the Sierra River and had 34,019 inhabitants in 1911. It is an important coaling station and a port of registry. Except for the planting of rice and cassava for local consumption, and the gathering of forest products, there are practically no industries. Besides kola nuts, palm oil and kernels, rubber, copal, hides, and ginger are exported. There is a government railway, with 2-foot 6-inch gauge,

from Freetown to Pendembu, a distance of 227½ miles. A branch runs from Boia Junction to Makump, 66¾ miles; another branch over the Rokell River to Makeme in the Karene district was opened to traffic in February, 1913. There is also a mountain railway from Freetown up the Lion Rock, a distance of 6 miles. In 1914 the total length of the line was about 300 miles. The imports and exports for the year 1912 were valued at £1,424,864 and £1,540,764 respectively. Revenue in 1912, £559,855; expenditure, £525,417; tonnage entered and cleared, 2,676,471, of which 1,872,980 tons British. The Governor in 1914 was Sir E. M. Merewether, appointed 1911.

SIKORSKY AEROPLANE. See **AERONAUTICS**.

SILK. The silk industry during 1914 was one in which various conditions ruled, but in the main was fairly satisfactory all things considered. Naturally American manufacturers were anxious to provide against any stoppage of foreign importations of goods and lack of raw material and dyestuffs, as the latter were for the most part imported from Germany. Commerce both on the Atlantic and Pacific was threatened by warships of the hostile powers, leading to increased insurance against war risk, and notwithstanding the fact that a record consumption of raw silk both in Europe and in the United States during the previous season had absorbed the large crop as well as the reserve stocks, there was a lack of raw material, and in August after the outbreak of the war a considerable premium was paid for ready stocks in the United States. In September the American mills were able to obtain sufficient raw silk to prevent their shutting down, but in October, financial conditions and lack of exchange disturbing the market, the mills unable to get orders for the spring trade were forced to reduce the production. The war brought about a reduction of raw silk in Italy and the curtailments since August were estimated at 25 per cent, while in Japan and Shanghai there was also a suspension of work in many cases. Nevertheless, silk fabrics continued to enjoy the favor of fashion, for broad silks as well as for ribbons.

The figures of raw silk production in the silk seasons 1912-13 and 1913-14, in pounds, including Tusseh silk, as given by the Silk Association of America, are tabulated herewith:

<i>Crop in Pounds</i>	<i>1912-13 Pounds</i>	<i>1913-14 Pounds</i>
Europe	9,337,000	10,981,000

China, Canton	5,995,000	4,961,000
Japan, Yokohama	26,650,000	28,851,000
India, estimated	254,000	408,000
Total, pounds	57,215,000	55,780,000
Tusseh, raw	2,757,000	3,219,000
Grand total, pounds	59,972,000	58,999,000

* The production of raw silk in China is an absolutely unknown quantity.

† Excludes Tusseh silk.

The figures for Asiatic silks are the actual ship-

ments from the various countries of production, viz.: China, Canton, Japan, etc.

The domestic consumption of Japan is estimated to be approximately 80 per cent of her production. The remaining 20 per cent which is exported, being say 26,650,174 pounds during the season 1913-14. The total production equals the export divided by 70 and multiplied by 100, which therefore amounts to 38,071,600 pounds.

The domestic consumption of China (including Tusseh silk) is estimated to be 55 per cent of her production in average years. The remaining 45 per cent which is exported, being 18,725,441 pounds from Shanghai and Canton during the season of 1913-14. The total production equals the export divided by 45 and multiplied by 100, which therefore amounts to 41,612,100 pounds.

There were a number of new silk mills built during the year and the record of new textile mill construction in the United States for 1914, compiled by the *Textile World Record*, showed that 51 mills were built for the silk trade. This was a slight decrease from the number of new mills built in 1913, but it was well above the average number erected yearly during the previous 10 years. Of the 51 new silk mills 12 were erected for ribbon manufacturing, 25 for broad silks, and the remainder divided between throwing and yarn mills. Pennsylvania reported 21 new mills erected, while New Jersey had 19, of which 13 were in Paterson. New mill construction was reported also from Maryland, Massachusetts, New Hampshire, New York, and Rhode Island.

SILO. See **OCCUPATIONAL DISEASES**.

SILVER. The total quantity of silver produced in the United States in the calendar year 1913 was 66,801,600 fine ounces, valued at \$40,348,100. This was a considerable increase over the production of 1912, which was 63,766,800 fine ounces, valued at \$39,197,500. The production in 1913 was the largest in the history of silver mining. The States producing the largest amount in their relative order were Nevada, Montana, Utah, Idaho, and Colorado. (Details of the production of these and other silver-producing States will be found in the sections *Mineral Production* under the States.) The price of silver per fine ounce averaged about \$0.60 in 1913. The following table gives the production of silver in the United States in the calendar year 1914:

<i>State or Territory</i>	<i>Fine ounces</i>
Alabama	100
Alaska	898,500
Arizona	4,306,600
California	1,744,500
Colorado	8,612,900
Georgia	100
Idaho	12,689,500
Illinois	1,800
Michigan	404,500
Montana	10,746,000
Missouri	60,000
Nevada	14,814,200
North Carolina	1,800
New Mexico	1,682,100
Oregon	126,700
South Dakota	180,500
South Carolina	100
Texas	601,000
Tennessee	95,400
Utah	11,897,500
Virginia	1,000
Washington	54,100
Wyoming	100
Philippine Islands	9,700
Porto Rico	1,500
Total	67,929,700

The production of silver in the United States in 1914, according to the estimates of the United

States Geological Survey, amounted to about 67,929,700 fine ounces, with a value of \$37,225,000. This was one of the greatest outputs since the mining of silver began, and but for the European War undoubtedly all records of production would have been broken. Increases in the mine production were notable in Idaho, California, and Arizona. Large decreases, however, were recorded in Montana, Utah, Nevada, and Colorado. Nevada retained first place in the silver output, with Idaho second. The production of Nevada decreased about 800,000 ounces, while that of Idaho increased about 3,000,000 ounces. The imports of silver in 1914 were valued at \$25,331,000 and the exports at \$50,500,000. See METALLURGY.

SIMPSON, WILLIAM KELLY. An American laryngologist and otologist, died at New York City on Feb. 6, 1914, aged 58 years. He graduated at the College of Physicians and Surgeons, New York City, in 1880. He was professor of laryngology in that institution for nine years; was consulting laryngologist to the Seton and St. John's hospitals, Yonkers, and the Somerset Hospital, New Jersey; laryngologist to the Vanderbilt Clinic; and consulting otologist to the Presbyterian Hospital, New York City. He was a Fellow of the American Medical Association and of the New York Academy of Medicine, and a member of the American Laryngological Society.

SINGAPORE. One of the Straits Settlements (q.v.).

SION, ALIX MARIE ADELAIDE DE. A French actress, who under the name of "Pasca" was at one time one of the foremost emotional actresses in France. She died May 25, 1914. She was born in Lyons in 1835, received a musical education in Paris, and although she developed remarkable talent as a singer, married at 20 years of age and abandoned her music. Five years later on the death of her husband she decided to go on the stage, studied declamation and the technique of the stage for three years, and in 1864 first appeared in *Le Demi-Monde* at Gymnase. A few years later in the character of Heloise Parquet, she achieved a remarkable success, and within three years had become one of the most famous of French actresses. In 1870 she went to Russia where she also was successful, and on her return to Paris her popularity grew even greater than before. In 1885, at the age of 50, she retired from the stage and until her death lived quietly in Paris.

SIX-HUNDRED-AND-SIX. See SALVABAN.

SKATING. The international outdoor amateur championships were held at Saranac Lake in January. Robert M. McLean of Chicago as in former years carried off the chief laurels. McLean won the 220-yard, the quarter-mile, the half-mile, the three-quarter-mile and the two-mile, events. In the international indoor championships, held at Cleveland, Ohio, McLean captured four races—the quarter-mile, the one-third-mile, the half-mile, and the one and one-half-mile. McLean also established the new record of 5 seconds for 50 yards at Lake Placid, N. Y.

O. Mathiesen of Norway and Ippolitow of Russia divided the honors at the world's championships held near Christiania, Norway, in February. Mathiesen won the 500-meters, the 1500-meters, and the 5000-meters. Ippolitow was

victor in the 10,000-meters. Norman Scott of Montreal won the figure skating championship at New Haven, Conn., in March.

SKYSCRAPERS. See ARCHITECTURE, and TALL BUILDINGS.

SLEEPING SICKNESS. The British government report on sleeping sickness was recently issued. The committee investigated the part played by wild animals in Africa, and the tsetse fly, and found that there were two distinct forms of sleeping sickness. The Uganda type, which appears to be a new disease, was first recognized in 1901. This type is violently epidemic and according to reliable estimates caused about 200,000 deaths between 1898 and 1906. The type found in Nyassaland and Rhodesia has been recognized as a distinct form only since 1908. It is more deadly but not epidemic. Only 153 cases in Nyassaland, and 107 in Rhodesia were recognized between 1908 and 1914. No treatment for the latter form has been successful, and the disease is looked upon as invariably fatal. The tsetse fly has been proved the carrier in both types, but Uganda sleeping sickness is caused by a different species of the tsetse fly from that which carries the Rhodesian form. The Uganda *Glossina palpalis* never goes far from water, whereas the Nyassaland insect, *Glossina morsitans*, is capricious in its distribution, is independent of water, and its movements are unknown. The committee finds that animals play a minor part, as compared with man, as a reservoir from which the fly derives the infection.

SMALLPOX AND VACCINATION. The January *Bulletin* of the New York State Board of Health gave a history of the smallpox epidemic at Niagara Falls. The article set forth the orders and communications issued and the measures taken to assist the local authorities in stamping out the epidemic in that city, which had been a centre of strong antivaccination sentiment. The disease first appeared in the spring of 1912 and existed practically continuously from that time to the present. It became epidemic in November, 1913, and up to the end of December there had occurred about 200 cases. It was checked and terminated by vaccination. There was a total of 823 cases in the State during 1913, only 20 of which occurred in New York City, which has more than half the population of the State. On February 24 the smallpox quarantine, which had been enforced for eight weeks, was removed. More than 20,000 persons were vaccinated, and there were 16 cases of smallpox under quarantine. Under the policy of resistance by the Dowieite community in Zion City, Ill., to the efforts of the Illinois State Board of Health, the number of cases of smallpox in that place increased to nearly 50. On November 3 the overseer of the community, under protest, consented to allow the State authorities to take charge of the situation. Dr. C. E. Crawford, medical inspector for the Illinois State Board of Health, at once instituted a rigid quarantine on the premises of all persons affected with smallpox and appointed six deputy inspectors to assist in maintaining quarantine. He prohibited public gatherings and canvassing from house to house, and ordered all children under 16 years of age to remain at home. All the inhabitants who were willing were vaccinated, the Illinois State Board of Health having no power under the law to compel vaccination. The sur-

rounding towns declared a rigid quarantine against Zion City. Of 714 cases of smallpox at the Louisville Eruptive Hospital during the year ended August 31, but one resulted fatally. The superintendent of the hospital called attention to the fact that 99 per cent of the smallpox patients received at the hospital had never been vaccinated or had been vaccinated without result. In order to form an idea as to how well the population of New York had been vaccinated, surveys were made of various groups in different sections. Information thus obtained regarding 12,437 persons showed that 12,096 or 96 per cent had been vaccinated. The average time which had elapsed since the last vaccination was 11 years. Fifty persons or .04 per cent had had smallpox, and 378 or 3 per cent had never been vaccinated. School children were well protected by vaccination which is required by law. Children under school age, however, constituted a large proportion of the unvaccinated. Of a total of 1580 children inquired about, 291, or 18 per cent, had never been vaccinated. In a negro tenement block 35 per cent of the children under school age had not been vaccinated. A campaign was set on foot to secure more complete vaccination of the entire population. A report from New Zealand in January, 1914, described an epidemic of smallpox in that country which affected 2000 people, chiefly Maori natives, who were very susceptible to the disease and who were not vaccinated. An epidemic prevailed at the same time in Australia, with 900 cases, but no deaths. The disease among the Maoris for the most part was mild, and the percentage of deaths small. On account of the character of these people, and their wandering life, accurate statistics could not be obtained. The disease was traced, it is said, to a case in a man from Utah, U. S. A., who had a pustular disease of a mild type while on the steamer going over. See HYGIENE; VITAL STATISTICS.

SMITH, CHARLES WILLIAM. An American Methodist Episcopal bishop, died Oct. 31, 1914. He was born in Fayette Co., Pa., in 1840, and was educated in various schools. In 1859 he was ordained to the Methodist Episcopal ministry, and was pastor in various churches in and near Pittsburgh until 1879. From 1880 to 1884 he was presiding elder of the Pittsburgh district, and from 1884 to 1908 was editor of the Pittsburgh *Christian Advocate*, in the latter year being elected bishop. He was a member of many important committees, and a trustee of several institutions, including Woman's College, Baltimore, and Puget Sound University, Washington. He was eight times a member of the General Conference of the Methodist Episcopal Church, and was a delegate to ecumenical conferences in Washington, London, and Toronto. He was a member and vice-chairman of the commission to revise the constitution of the church from 1896 to 1900, and was also a member of the joint commission on unification of Japanese Methodism by which members of these churches in Japan were organized into an independent church—the Methodist Church of Japan.

SMITH, JOHN BUTLER. An American public official, former Governor of New Hampshire, died Aug. 10, 1914. He was born at Saxton's River, Vt., in 1838, and received an academic education. In 1864 he began the manufacture of hosiery and knit goods, and built up a large business at Hillsboro. He served as presiden-

tial elector in 1884, and was a member of the Executive Council of New Hampshire from 1887 to 1889. In 1893-94 he was Governor of that State.

SMITH, JOSEPH. President of the Reorganized Church of the Latter Day Saints, died Dec. 10, 1914. He was the son of Joseph S. Smith, founder of the Mormon Church, was born at Kirtland, Ohio, in 1832, and received a common school education. After the removal of the main body of Mormons to Utah, he remained with his mother's family in Missouri, where he kept a hotel, and worked on a farm till he reached his manhood. He studied law, but did not seek admittance to the bar. In 1870 he became president of the Reorganized Church of the Latter Day Saints, a body opposed to polygamy and not affiliated with the Church in Utah. He was editor of the *Saints' Herald*, the organ of his denomination, from 1863 to the time of his death.

SMITH, SIR WILLIAM ALEXANDER. A Scotch philanthropist, died May 11, 1914. He was born in Thurso, Scotland, in 1854, and was educated at the Academy in that town. In 1874 he entered the First Lanarkshire Rifle Volunteers, and retired as honorary colonel in 1908. In 1883 he founded the Boys' Brigade, which became a very successful organization until it was superseded to a large extent by the Boy Scouts. He made several visits to Canada and the United States, visiting the Boys' Brigade in those countries, and in 1908 he commanded a parade of 10,000 boys before Prince Arthur of Connaught in Glasgow on the occasion of the semi-jubilee of the brigade. He served in 1909 on Sir John Dewar's departmental committee on the employment of boys and girls from the congested districts of the Highlands.

SMITH COLLEGE. An institution for the higher education of women, at Northampton, Mass., founded in 1871. There were enrolled, in all departments in the autumn of 1914, 1638 students, and the faculty numbered 146, exclusive of library and office staff. There were 29 additions to the faculty at the beginning of the collegiate year 1914-15. There was raised during the year an endowment fund of \$375,049. The productive funds of the college amounted at the end of the college year 1913-14 to \$1,695,892 and the income to \$78,502. The library contains approximately 50,000 volumes. The president is Marion L. Burton.

SMITH-LEVER EXTENSION ACT. See UNIVERSITIES AND COLLEGES, *University Extension*.

SMITHSONIAN INSTITUTION. During 1914 the institution continued to carry on investigations in various lines throughout the world by means of allotments from its funds. By a resolution of the Regents on May 1, 1913, the secretary was authorized to reopen the Smithsonian Institution laboratory for the study of aerodynamics to be known as the Langley Aerodynamical Laboratory. The functions of the laboratory include the study of the problems of aerodynamics, particularly those of aerodynamics, with such research and experimentation as may be necessary to increase the safety and effectiveness of aerial locomotion for the purposes of commerce, national defense, and the welfare of man. Work was carried on in this laboratory during 1914. An interesting feature of the year was the reconstruction and successful launching

of the Langley aeroplane. The tests which were made by Mr. Glenn H. Curtiss showed that Mr. Langley had succeeded in building the first aeroplane capable of sustain free flight with a man. During the fiscal year 1913-14 the director carried on geological researches in the Canadian Rockies, and Dr. R. H. Bassler studied the geological history of the Appalachian Valley of Maryland. Work was also in progress on a geological survey in Panama, authorized in 1913. Researches in natural history and ethnology provided by a special trust fund established by Mrs. E. H. Harriman were carried on by Dr. C. Hart Merriam during 1913-14, the principal work being on the big bears of America. Steps were taken toward the organization of an American School of Archaeology in China.

The institution issued during the year 6807 printed pages, with 834 plates of illustrations. The aggregate distribution was 202,871 copies of pamphlets and bound volumes. Plans for the new George Washington Memorial Building, authorized by Congress in 1913, were selected in May, 1914, and construction work will begin in 1915. The cost of the building will be about \$2,000,000.

SMOKE ABATEMENT. A number of additional *Smoke Investigation Bulletins* embodying studies made by the Mellon Institute of Industrial Research and School of Specific Industries were issued during the year by the University of Pittsburgh. See METEOROLOGY.

SOCER. See FOOTBALL.

SOCIAL ECONOMICS. During the past decade there has come into rather extensive use the term Social Economics to distinguish a new point of approach to the problems of economic life. The long-established viewpoint of orthodox economists had been that almost the sole object of economic effort and organization was to increase the volume of production. The new school starts with the assumption that the quantity of wealth is sufficient to make possible a high standard of well-being for all; and that consequently the most important problems are those dealing with the distribution of wealth and the relations of economic activity to health, safety, the standard of living, and the betterment of the lives of workers. This viewpoint rejects to a very large degree the doctrine of *laissez faire* and would boldly grapple with social and economic organization and the conditions of human life so as to spread the best fruits of modern culture to all ranks of society. Material coming within the scope of Social Economics will be found under the following headings: CHILD LABOR; LABOR; LABOR LEGISLATION; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; PROSTITUTION; SOCIAL INSURANCE; SOCIOLOGY; WELFARE WORK; WOMEN IN INDUSTRY; and WORKMEN'S COMPENSATION.

Bibliography. In addition to the following books the reader should consult references under POLITICAL ECONOMY and SOCIOLOGY: E. N. Bennett, *Problems of Village Life*; R. H. Best and C. K. Ogden, *The Problem of the Continuation School and its Successful Solution in Germany*; G. Blaiklock, *The Alcohol Factor in Social Conditions*; F. E. SOCIAL HYGIENE. See HYGIENE; and PROSTITUTION, *National Conference*.

SOCIAL INSURANCE. One of the most important phases of social legislation of recent years has been the application of the insurance principle to various classes of events, such as accidents and sickness which have far-reaching effects on the welfare of the industrial population. The inability to find work, the loss of time or of working capacity resulting from injury or disease may result in the moral and physical degradation of the worker and his family. Poverty thus induced is followed frequently by chronic ill-health, vice, crime, and a host of other ailments from which society as a whole suffers heavily. These incidents of life are therefore comparable to death, in that they may occur at any time in the life of any one, and may entail hardship on others. They can therefore be met, in part, by insurance, as some of the evils of death are met by life insurance. Thus there has developed a considerable demand for insurance against unemployment (q.v.); and against accidents during employment (see WORKMEN'S COMPENSATION); against diseases peculiar to certain trades (see OCCUPATIONAL DISEASES); against the inevitable incapacities of age (see OLD-AGE PENSIONS); and against sickness and premature old-age. The latter is known as invalidity insurance.

The National Civic Federation delegated Mr. J. W. Sullivan of the Typographical Union and Mr. P. Tecumseh Sherman of New York to investigate European schemes of compulsory insurance against sickness, in force in 1914. The world-wide interest in the subject has resulted in the International Congress on Social Insurance, which will hold its ninth biennial session at Washington, D. C. in September, 1915, at the invitation of the Federal Government. A very extensive American committee on arrangements has been formed, headed by three members of the Cabinet, the secretaries of Labor, Treasury, and Commerce.

COMMITTEE ON SOCIAL INSURANCE. Early in 1913, the American Association for Labor Legislation created a Committee on Social Insurance (see LABOR LEGISLATION, AMERICAN ASSOCIATION FOR); this was followed some months later by the first American conference on social insurance, at Chicago, and the publication of a classified bibliography on the subject; then, in December,

1913, sickness insurance was discussed at the annual meeting at Washington. The Committee then formulated, after many sessions, and issued in July the main principles upon which it proposed to draft a sickness insurance bill. These included the following: sickness insurance should be compulsory, on the basis of joint contribution of employer, employee, and the public; the compulsory system should include all workers so far as practicable; voluntary insurance should be provided for certain groups of workers and others; sickness insurance, providing for 26 weeks, should be supplemented by invalidity insurance with separate funds; sickness funds should be in charge of local committees representing all parties; a federation of local trades, for medical relief, is desirable; invalidity insurance should be met by funds covering several sickness districts and administered on a representative basis; both funds should provide adequate medical service, supplies, nursing, and hospital care; cash benefits also should be provided; prevention should be emphasized as a means of stimulating a national movement for health conservation.

COMMERCIAL INSURANCE. In July the Metropolitan Insurance Company announced that it would issue contracts of insurance against sickness or accidental injuries not arising out of and in the course of employment, to groups of persons representing employees of firms, labor unions, lodges, or others, whether men or women. These new policies provided for full benefits for a first period of 26 weeks; one-half benefits for a second subsequent period of $4\frac{1}{2}$ years; and one-fourth benefits for a third period up to age 65. No benefits were to be paid during the first seven days of disability, nor for the first 13 weeks of insurance. This plan was a natural extension of the schemes of sickness and accident insurance offered by numerous casualty companies of the country, and was welcomed by those engaged in the promotion of social insurance.

SOCIALISM. INTERNATIONAL ORGANIZATION. In the interim from one International Socialist Congress to the next, the general affairs of the international movement are managed by a bureau formed of delegates of the 41 Socialist parties of 27 countries, and having its permanent seat in Brussels. In January, 1914, the International Bureau issued a manifesto to the Socialists of Great Britain urging the British Socialist party, the Fabian Society, and the Independent Labor party to carry out the work of unification started in the preceding December by the special session of the International Bureau in London (consult the YEAR BOOK for 1913). During the spring the International Bureau was chiefly concerned with plans for the International Congress which was to be held in Vienna on Aug. 23, 1914. The Congress was to discuss problems connected with unemployment, high cost of living, alcoholism, imperialism, and Socialist tactics in case of war; and it was hoped that the great International Congress, representing powerful Socialist organizations in more than a score of countries, would commemorate in jubilant fashion the founding of the International Association of Workingmen by Karl Marx fifty years ago. The War of the Nations, however, prevented the Vienna Congress and shattered the international organization. Brussels, the seat of the International Bureau, was occupied by German armies. The Dutch Socialists requested the reestablishment of the Bureau in the Nether-

lands; Americans favored the United States; but the Bureau was not reconstructed. An International Socialist Peace Conference was called to meet at Copenhagen in January, 1915.

INTERNATIONAL SOCIALISM AND THE PREVENTION OF WAR. The famous Austro-Hungarian ultimatum to Serbia (July 23) brought international Socialism face to face with the most serious test it had yet had to withstand. Again and again the assertion had been made that the Socialists would not allow a great war in western Europe. Inspired by the command of Karl Marx—"Workingmen of the world, unite!"—The Socialists stood for the international brotherhood of the working classes, scornful of national boundaries, and hostile to all bourgeois governments. The war on capitalism was supposed to be the only war in which Socialists would willingly fight. Many believed that the universal Socialist demonstrations against war and the temper of the International Socialist Congress of Basle, November, 1912, had prevented the Balkan conflagration from inflaming all Europe and had given proof that a threat from the working classes could compel the bourgeois governments to keep the peace. As late as July, 1914, the Socialist party in France approved the much discussed contention that in case of last resort the Socialists should declare a general strike as the most effective means of preventing war. When, therefore, in that terrible week at the close of July, the nations of Europe hesitated on the threshold of the world's greatest war, some prompt deterrent action, a general strike, an insurrection, if need be, was looked for from the Socialists who had so unsparingly denounced modern warfare. No general strike was called. No insurrection occurred. With all its pacific plans, with all its 4,500,000 voters in Germany, its 1,500,000 voters in Austria, its 1,400,000 voters in France, its 900,000 voters in Italy, and its numerous adherents in other countries—Socialism was powerless. Socialists could only protest. On July 29, the day after Austria-Hungary declared war on Serbia, a huge anti-war mass-meeting was held in the Cirque Royal of Brussels. The chairman of the meeting, M. Vandervelde, announced that the International Socialist Congress would be held on August 9 instead of August 23, and in Paris instead of Vienna, with the object of discussing measures for the prevention of a world-wide war. At the Brussels meeting Keir Hardie from Great Britain, Haase from Germany, Jaurès from France, Agnini from Italy, Roubanovitch from Russia, Troelstra from the Netherlands, Iglesias from Spain, Branting from Sweden, Stauning from Denmark, and Grimm from Switzerland eloquently testified that international Socialism was anxious for peace. In Berlin on July 29, 27 meetings brought out 60,000 manifestants against war. Anti-war demonstrations were organized in other great German cities. On August 2 a monster meeting in Trafalgar Square, London, applauded the orations in which Keir Hardie, Ben Tillett, and other labor leaders urged Great Britain not to follow Germany and Russia into the arena. But mass-meetings and passive protests were of no avail. Jean Jaurès, the brilliant orator of the French Socialists, was murdered by a misguided fanatic, July 31. (See JAURÈS). No other Socialists were reported to have died for their belief in the international solidarity of labor. That international Social-

ism had failed to prevent the war, was obvious; the reasons for the failure were almost equally obvious, although often overlooked. In the first place, the whole machinery of international communication was so choked by telegrams, letters, refugees, mobilizing soldiers, and war supplies, that the leaders in the various countries could not easily keep in touch with each other. The introduction of the censorship and martial law completed the isolation. Even in spite of this difficulty, the Socialists might have done something, had they known what to do. But the International had never been able to decide unreservedly in favor of an automatic general strike in all countries in case of threatened war. This was the most powerful reason for the collapse of Socialist pacifism. The Socialists in France were not willing to cripple their country by striking, unless the Socialists of Germany would certainly and simultaneously do likewise. Consequently, the most that could be done was to call the International Congress to convene at Paris, August 9, for the discussion of tactics. Needless to say, the Congress was never held. The time for discussion had passed.

SOCIALISM AND PATRIOTISM. It might perhaps have been expected that even after the declaration of war, the Socialists in the various belligerent nations would have opposed the war, would have resisted enlistment, would have suffered death as traitors to their country rather than help to kill "Comrades" in the enemy's army. On the contrary, we find French and Belgian Socialists forgetting their hatred of the bourgeoisie, joining in cabinets for "national defense"; we find the 110 Socialist votes in the Reichstag cast in favor of the German war budget; we find Gustave Hervé voluntarily enlisting in the French army; we read of the German Socialist Frank's gallant death on "the field of honor" at Liège. The Russian Socialists, some of the British Socialists, and a minority of the German Social Democrats remained more or less passively un-patriotic. The Belgian, the French, many of the British, and most of the German Socialists espoused the cause of their respective nations in the war with violent patriotism and ardent enthusiasm. Details will be given below in the sections on the various countries; in this place, however, it may be remarked that in the flood of controversial literature regarding the attitude of the Socialists toward the war, three facts have emerged. (1) In the first place, the Socialist party, in Germany, for example, depended so largely on the votes of bourgeois "intellectuals," middle-class progressives, and miscellaneous malcontents, that to a surprising extent opportunist grasping for immediate advantages had superseded the old fanatical belief in an inevitable proletarian revolution. Only a fraction of Germany's 4,500,000 "Socialist" voters were thorough-going Marxians; and not all of the convinced Socialists could be depended upon to place their economic creed before their country's need. Similar statements might be made of the other countries. (2) In the second place, many Socialists became patriots because they considered it just to defend their country against an unwarranted attack. To all Socialists the distinction between a "war of aggression" and a "war of defense" was familiar: against the former the Socialist was bound to protest, in the latter he might rightly fight. The distinction was a fatal one. The German So-

cialists said they were fighting in a war of defense; the French and Belgians swore that their countries had been foully attacked by Germany; the British declared that Prussian "Junkedom" was to blame. Where did the truth lie? Taught by sad experience, some Socialists regretfully admitted that the "war against war" meant nothing so long as a distinction was maintained between wars of aggression and wars of self-protection. (3) In the third place, the war forced home the fact that Social Democracy achieved on a national basis might have the effect of intensifying rather than abolishing international strife. Because social insurance, factory regulation, a strong organization, and the possession of 110 representatives in the Reichstag made the outlook for Socialism seem brighter in Germany than in Russia, the German Socialist felt the better justified in defending German "Kultur" against "Czarism." In like manner French, Belgian, and British Socialists argued that they were fighting in behalf of democratic government as against German militarism and imperialism. Thoughtful writers, moreover, gloomily prophesied that in proportion as the working classes in any nation attained political liberty and economic well-being, they would become the more earnestly patriotic, and would fiercely desire to uphold the independence and enhance the prosperity of the nation upon which their own liberties and interests depended. Unless nations could be taught a wise unselfishness, Social Democracy would intensify nationalism and would make national rivalries the more terrible, because the more popular.

POSSIBLE ADVANTAGES FOR SOCIALISM. Optimistic Socialists, far from becoming discouraged at the failure of the International to prevent war, claimed that the war only confirmed their theories and would contribute to their triumph. The war was the greatest crime of the capitalist governments of Europe; it meant the collapse of capitalist society. In the heat of war the various governments had taken mighty strides toward Socialism. Governments had assumed the power to regulate prices, to run the railways, to engage in insurance and banking enterprises. The alleviation of misery was being undertaken on a more comprehensive scale than ever before. The old doctrine of *laissez faire* had at last been abandoned; and at the close of the war no argument would be left to the opponents of government-regulation and government-ownership. More than that, the misery and destruction caused by the war would call for a very considerable amount of State Socialism. In some countries, possibly, the working classes would rebel against the suffering which the government had brought upon them, would rise in arms, and bring about a social revolution. As the Paris Commune had followed upon the Franco-Prussian War, a much greater proletarian upheaval would follow upon the War of the Nations.

FRANCE. The Congress of the Unified Socialists at Amiens, January 25-28, gave evidence of the old divergence of opinion between the opportunist Jean Jaurès and the Marxian Jules Guesde. In the forthcoming elections for the Chamber of Deputies, M. Jaurès wished to cooperate with the Radicals and thus to enjoy the advantage of official support in the second balloting. Jules Guesde disliked the idea of any agreement with the bourgeois parties. The opportunist view triumphed, and the Congress

adopted a carefully worded resolution which reaffirmed the absolute unwillingness of the Socialists to enter into any alliance or participate in any coalition cabinet with the bourgeois parties, but at the same time recommended the Unified Socialists on the second ballot to support the candidates of the other parties who most clearly and vigorously combated the Three Year Law, war, chauvinism, and "the military-clerical coalition." The resolution, in effect, meant combination with the Unified Radicals, whose programme consisted in anti-militarism, anti-clericalism, and fiscal reform. Against this decision of the Congress, a strenuous protest was raised by MM. Allemane, Chauvin, Nègre, and Le Gléo, who formed a "Labor Party" and issued a manifesto bitterly condemning the Unified Socialists:—"The resolution voted at the International Congress of Amsterdam, which forbade Socialists of all nations to form agreements, coalitions, or ententes with the bourgeois political parties, has been trodden under foot by the majority of the Socialist party. This majority has hypocritically concluded an electoral alliance with the most despicable and the most criminal of all political parties, the Radical party." The schism, however hurtful to party prestige, had little effect upon the elections. The first ballot gave the Socialists 1,398,771 votes, a gain of 288,210 since 1911. The large increase in the number of Socialist votes was due partly to the fact that candidates were presented even in districts where there was no chance of election, for the purpose of propaganda. The increase in the size of Paris also contributed to the Socialist gain. With the advantage of Unified Radical support in the second ballot, the representation of the Unified Socialist Party in the Chamber was increased to 101 members. At a meeting in July, the Socialist party approved the principle of an international general strike as a preventive of war. At the outbreak of the War of the Nations, as has been already stated, Jean Jaurès, the leading French Socialist, was assassinated because of his well-known anti-militarist convictions. The assassin might have spared himself the pains, however, for more strenuous opponents of militarism than M. Jaurès suddenly became patriots. Two prominent Unified Socialists, Jules Guesde and Marcel Sembat, accepted office in the cabinet. Gustave Hervé, who had once advised French soldiers to desert in case of war, now voluntarily offered to serve in the army. The Syndicalist C. G. T. (General Confederation of Labor) exhorted all trade unionists to fight for France. The anti-militarist plank in the Socialist platform had dropped out; or, rather, the French Socialists continued to regard themselves as anti-militarists inasmuch as they were fighting against German militarism.

GERMANY. To instill fresh vigor into the Socialist propaganda, and to combat the government's anti-Socialist policy (see **GERMANY**) the Social Democratic party instituted a "Red Week" in the spring. During that week a lively campaign was conducted, with the result that 140,096 new active members were added to the organization, 28,661 of them being women; 82,537 new subscriptions were secured for Socialist journals; and the number of dues-paying members was increased to 1,100,000. In July, Herr von Heydebrand, the leader of the Prussian Conservatives, warned the Imperial Chancellor that he must take stern measures against the Social-

ist menace; at the same time Rosa Luxemburg was put on trial for a subversive speech in which she had alleged that acts of cruelty and barbarity were of daily occurrence in the army. With the aid of the Socialist organization, she produced over a thousand witnesses to substantiate her apparently rash assertion. The case was dropped, but it gave *Vorwaerts*, the Socialist daily, the text for many sermons. At the end of July came the news of the Austro-Hungarian ultimatum. *Vorwaerts* warned the German government not to support the outrageous ultimatum. Mass-meetings were held in the large cities to demonstrate the desire of the German Socialists for peace. As soon as the war broke out, however, tactics were reversed. At the session of the Reichstag on August 4 Herr Haase announced that the Socialist group would vote in favor of the war budget as proof that in time of peril the Socialists would not betray their country. The German Socialists took this stand in spite of their knowledge that Belgium and Luxemburg had been invaded. Party manifestoes, and the declarations of Scheidemann, Südekum, and other Socialist leaders convinced the most incredulous observers that the German Socialists were as ardent patriots as any, fighting against Russian "Czarism." Some of the Socialist deputies fought in the army, and one at least, Herr Frank, met death in battle. A few of the Socialists were immune from the war-fever. Karl Liebknecht, with a faithful few, it appeared, had opposed the action of the majority in approving the war budget, but, bowing to the unit-rule, had voted as the majority dictated. When all the other Socialists voted for the second war loan on December 2, Karl Liebknecht alone registered his vote in the negative, declaring, "This war is not a war of German defense." "It is an imperialistic war, a war for the domination of the world market, for the political domination over important fields of operation for industrial and bank capital. It is a war mutually fostered by German and Austrian war parties in the darkness of half-absolutism and secret diplomacy in order to steal a march on the adversary." In a message to the Socialists of England, printed in the *Labor Leader* for December 31, Karl Liebknecht confirmed the impression which various statements from Rosa Luxemburg and a few other revolutionaries had created: "Among the German working people there is already a greater opposition to the war than has generally been supposed." It is an important fact that *Vorwaerts*, although twice suppressed, was allowed to continue publication and even permitted to be circulated in the army, in spite of the fact that in its columns occasional veiled hints appeared which might serve to dampen the patriotic ardor of Socialist soldiers.

GREAT BRITAIN. On December 13, as recorded in the 1913 YEAR BOOK, the executives of the British Socialist party, the Independent Labor party, and the Fabian Society met the members of the International Socialist Bureau at Clifford's Inn, London, and agreed that the representatives of the three bodies should lay before their adherents the question of asking the Labor Party Conference in 1915 to permit candidates to run for Parliament as "Labor and Socialist" representatives. The Conference also decided to hold joint meetings to promote the close alliance of the three separate Socialist organizations in Great Britain. A tripartite committee with

Mrs. Sidney Webb as chairman was appointed to arrange a series of large "unity" mass-meetings in Glasgow, Birmingham, Manchester, Cardiff, Newcastle, Leeds, and London. On January 13 the International Bureau issued a manifesto exhorting the British Socialists to unity. "At the Congress of Vienna," the manifesto urged, "British Socialism must speak with one voice." The fourth congress of the Labor party at Glasgow, beginning January 27, reproached Macdonald and the other representatives of Labor in Parliament with truckling to the Liberals and with neglecting opportunities of advertising their own programme. The Labor party put itself at variance with the International by repudiating proportional representation as entailing too great an electoral expenditure, by a vote of 1,387,000 to 704,000. British Labor and Socialist organizations protested against the deportation of strike leaders from South Africa, and held a big protest meeting in Hyde Park. Tom Mann was sent to conduct an agitation in South Africa, but little could be accomplished, owing to the complication of the South African labor question by the race question. When the War of the Nations broke out in Europe, the British Socialists endeavored to prevent Great Britain from joining in the fray. A great mass-meeting in Trafalgar Square on August 2 declared for nonintervention. But when war was actually declared, the rank and file of the Labor party, which never had been Socialist, decided to drop all opposition, and strove simply for the protection of working-class interests during the war. John Burns, "renegade" Socialist, withdrew from the cabinet, presumably because he had favored peace. J. Ramsey Macdonald resigned the leadership of the Parliamentary Labor party; but he did not undertake a crusade against the war. The Labor members and prominent trade union officials issued a manifesto in the name of the Labor movement calling for patriotic support of the motherland. The Independent Labor party, however, under the leadership of Keir Hardie, remained hostile to the war and refused to support the government. George Bernard Shaw, the satirical Fabian, penned vitriolic indictments of the British landed aristocracy, and urged the Labor party to continue its class-conscious political action despite the war; but his utterances could not be interpreted as representative of much more than his own highly individualized self.

ITALY. The determination of the Socialists to hold a nation-wide demonstration against militarism and imperialism, the prohibition of the demonstration by the government, and a clash with the police, precipitated a general strike in Italy, June 8-10, which involved nearly 2,000,000 workers, caused 20 deaths, and brought some 6000 strikers into the police courts (see STRIKES). The threatening aspect of the labor situation was doubtless one of the considerations, though not the most important, which deterred the Italian government from entering the war. The Italian Socialists persisted in their disapproval of the German Socialists, notwithstanding the arguments advanced by Dr. Albert Südekum, German Socialist deputy from Nuremberg, who was sent to justify the German cause in Italy. On October 26, the Italian Socialists joined with their Swiss comrades in a meeting at Lugano and declared that they would regard any attempt to involve in the war any now neutral nation as

a crime against the working classes; the Lugano meeting also requested Socialists in all neutral countries to demand the opening of diplomatic negotiations for peace.

RUSSIA. One of the Social Democrats in the Duma incurred the displeasure of the government by advocating republicanism in a speech on the floor of the Duma. When the government threatened to punish him, the Social Democrats caused a tumult which was terminated only by their forcible expulsion. In the latter half of July a general strike withdrew possibly 200,000 men from industry in the city that was then St. Petersburg, and possibly 500,000 in the country. (See STRIKES). The strike speedily took on a revolutionary nature; barricades were thrown up in the capital; and on July 26 the government felt it necessary to declare a state of siege in Petrograd and Moscow. Although the threatened revolution of the working classes was averted by the patriotic outburst at the beginning of the war, the Social Democrats in the Duma opposed both war and government with unfaltering constancy. When the Belgian Socialist Vandervelde wrote, urging them to support the war against German militarism, the Russian Social Democrats (the "majority group," see 1913 YEAR BOOK) replied that they were determined to "oppose the Russian government in the interest of Russian freedom," and could on no account assist the autocratic government of the Czar to achieve the victory. A semi-official announcement late in November indicated the existence of a Socialist plot against the government and reported the arrest of five members of the Duma and several other Social Democrats.

SWEDEN. In the elections of March 27-April 7, the Socialists, advocating the reduction of the term of military service to six months, gained 9 seats from the Liberals, so that the Socialist fraction in the Lower House numbered 73 members. In a second election in September, the Socialists still further increased their representation to 87, again at the expense of the Liberals. The Social Democratic leader, Branting, now proposed that a working agreement or minimum programme be arranged with the Liberals, and a coalition ministry formed, in which the Social Democrats would have the preponderance. As Branting's proposition was approved by the Social Democratic Congress which met late in November, the establishment of a Socialist-Liberal ministry in place of the Conservative Cabinet was looked for in the near future. On the question of militarism, the Congress of the Swedish Social Democratic party was badly divided; but with 70 votes to 61 the Congress approved the policy enunciated by Branting, that Sweden could not disarm herself while other nations were augmenting their armaments. The best the Swedish Socialists could do, said the leader, was to limit the armament expenditures so as to leave some margin for the work of social betterment.

UNITED STATES. With a certain amount of consternation Socialist sympathizers in the United States learned that the *New Review* had been barred from propagandist meetings of the Socialist party because the editor, Herman Simpson, had signalized in an editorial the fact that from June, 1912, to June, 1913, the Socialist party had lost 50,000 members or more. Another discouraging occurrence was the defeat, April 7, of the former Social Democratic mayor of Milwaukee, Emil Seidel, who was opposing

the reflection of Mayor G. A. Bading in that city. Probably the most serious obstacle to the progress of the Socialist movement was its inability to conciliate or convert the other labor movements, the American Federation of Labor and the Syndicalist Industrial Workers of the World. Striking testimony to this lack of harmony was afforded by the hearings before the Federal Commission on Industrial Relations in New York City in May, when the Socialist attitude was set forth by Morris Hillquit, the trade union method by Samuel Gompers, and the I. W. W. spirit by Vincent St. John and Joseph Ettor. With a paid-up membership of only 14,000, the I. W. W. was nevertheless an active ferment in the labor world, spreading the idea of industrial warfare, and playing a prominent rôle in the Colorado miners' war and other strikes (see *STRIKES*, *Colorado Strike*, etc.). Upton Sinclair, who picturesquely demonstrated his sympathy with the Colorado miners, upbraided Hillquit and other Socialist leaders for failing to give solid support to the strike. Although possessing some influence in the American Federation of Labor, the Socialists were decidedly impatient with "the Gompers machine" and antagonistic to the Catholic element in the Federation. After the November Convention of the A. F. of L., Eugene V. Debs declared that the Socialists would do well to withdraw from this "federation of craft unions," and form a new, united, revolutionary, proletarian union. The amalgamation of the Socialist party and the Socialist Labor party was urged by a joint conference of the two parties in the State of Minnesota, April 26. In the elections on November 8 the Socialists elected Meyer London to Congress from a New York constituency. The number of Socialists in the various State Legislatures was 31, divided as follows: California, 2; Idaho, 1; Illinois, 2; Kansas, 1; Massachusetts, 1; Minnesota, 2; Montana, 2; New Mexico, 1; Nevada, 2; Oklahoma, 6; Pennsylvania, 1; Utah, 1; Wisconsin, 9. The total Socialist vote in 1914 was 687,495, as compared with 901,873 in 1912; the Socialist Labor party polled 30,344, as compared with 29,259 votes in 1912.

A proposed peace programme of the American Socialist party, drafted by a sub-committee of the National Executive Committee, was bitterly attacked by A. M. Simons in the New York *Call* for offering to compromise with the "hell" of militarism, and for advocating the establishment of an "international police force," which might become an effective instrument for the suppression of democratic and social revolutions. More protests were evoked by the militaristic pronouncement of the Milwaukee Socialists in favor of a "citizen army" to defend American industrial civilization against Asiatic invasion. On November 19, in a Cooper Hall speech which bids fair to become a classic, Morris Hillquit declared himself more patriot than Socialist. "If there is anything the war can teach us," he said, "it is that when national interest comes into conflict with any other, even class interest, it will be the stronger. National feeling stands for existence primarily, for the chance to earn a livelihood. It stands for everything we hold dear—homes, language, family, and friends. The workingman has a country as well as a class. Even before he has a class." For American topics affecting Socialism, see the article UNITED STATES, *passim*.

OTHER COUNTRIES. In the Australian elections on September 5, the socialistically-inclined, but highly militaristic, Labor party triumphantly elected 41 members to the House of Representatives and 31 to the Senate, thus commanding a majority in both houses (see AUSTRALIA). The Socialist party in Belgium received a gift of \$1,000,000 from Ernest Solvay, the famous Belgian chemical manufacturer. In the elections on May 24 for the partial renewal of the Belgian Chamber of Deputies, the Socialists gained one seat, increasing their representation to 40. In Canada, the provincial elections in Ontario on June 29 showed 5185 Socialist votes, an increase of 1881 since Dec. 5, 1911. The Socialist party in the Netherlands was active in urging the reestablishment of the International Bureau in their country. At a Socialist party Congress in Serbia, 128 delegates listened to the remarkable speech of a comrade from Bulgaria who advocated a republican union of the two nations and boasted that in the last Bulgarian election 37 Socialists were elected. Largely as a result of the labor disturbances, the South African Labor party gained 1 seat in the Union Legislative Assembly, 21 seats in the Transvaal provincial council, 3 in the Natal provincial council, 1 in the Cape provincial council, 3 in the Bloemfontein municipal council, and 1 in the Kroonstad municipal council. In Switzerland the Social Democratic party exerted itself to prevent the further extension of the War of the Nations, and requested the Swiss President to take the initiative in peace negotiations. The question of militarism threatened to split the party into three groups.

SOCIALIST BUREAU, INTERNATIONAL. See SOCIALISM, *Great Britain*.

SOCIALIST CONGRESS, INTERNATIONAL. See SOCIALISM, *International Organization*.

SOCIAL PHILOSOPHY. See PHILOSOPHY.

SOCIAL SERVICE, AMERICAN INSTITUTE OF. An institution organized in 1898 for the object of gathering and disseminating information on all branches of social thought and service. It supplies information and advice as to methods by correspondence, by publications, and by lectures. The Institute publishes the *Gospel of the Kingdom*, devoted to studies and social reform from a Christian standpoint. The 1915 series will take up the study of the following topics: "The Social Dynamic," "Strikes and the Public," "Anarchy," "Our Courts Just or Unjust," "Prison Reform," "Municipal Home Rule," "Town and Village Betterment," "The Negro," "Profit-Sharing," "The Threat of the Orient," "The New America," "The Church's Responsibility." The president is Dr. Josiah Strong and the lecturer Dr. James H. Ecob.

SOCIETIES, ART. For exhibitions held by various societies and associations, see PAINTING AND SCULPTURE.

SOCIOLOGICAL CONGRESS, ALABAMA. The second annual session of the Alabama Sociological Congress was held at Birmingham, May 3-5. It furnished the impetus and the organized basis for four movements: a State social service committee with local branches in ten cities; a State antituberculosis campaign; a State child-welfare movement; and the creation of a negro department of the Congress in charge of negroes. The Congress also prepared the following social programme for Alabama: a workmen's compensation law; compulsory education;

improved child-labor legislation; advance of age of consent to 21 years; a State health code; anti-tuberculosis laws; equal suffrage; equitable distribution of school revenues; a probation system; a remedial loan system; and a State housing code.

SOCIOLOGICAL CONGRESS, SOUTHERN. This society held its third annual session at Memphis, Tenn., early in May. The idea of constructive statesmanship that animates the conference was shown in its motto. "The solid South for a better nation." It cooperated with the National Conference of Charities and Corrections (see CHARITIES) in arrangement of programme. This was due to the fact that the Congress usually covers such topics as public health, courts, prisons, child labor, organized charity, race relations, the church, and social service. As a result, the Congress devoted itself very largely to problems of race relations, on which addresses were given by many distinguished speakers, including Bishop Theodore Bratton of Mississippi, Booker T. Washington, Mrs. Florence Kelley, Maj. R. B. Moton of Hampton Institute, and Dr. C. V. Roman of Nashville. A rational and constructive attitude toward the condition of the negro was steadily maintained. In the department of church and social service it was brought out that in the South the church is still the most important educational and social factor in community life; and that to-day the South is facing a religious and social crisis requiring wise leadership and sane constructive progress.

SOCIOLOGICAL SOCIETY, AMERICAN. This society held its ninth annual meeting at Princeton University, Princeton, N. J., December 28-31. The general subject of the meeting was "Free Communication." At the same time and place were held sessions of the American Statistical Association and the American Economic Association. The address of President Edward A. Ross dealt with "Freedom of Communication and the Struggle for Light." Mr. John Graham Brooks read a paper on "Freedom of Assemblage in the United States since 1890," while Police Commissioner Arthur Woods of New York City treated the subject, "Reasonable Restrictions Upon Freedom of Assemblage." A session devoted to "Freedom of Speech," included papers by Prof. Roscoe Pound of the Harvard Law School and James B. Reynolds of the American Social Hygiene Association. "Freedom of the Press in the United States since 1890" was the subject of Prof. Henry Schofield of Northwestern University Law School; while Mr. Charles H. Grasty of the Baltimore *Sun* spoke on "Reasonable Restrictions Upon Freedom of the Press." In the same manner "Freedom of Teaching in the United States" by Prof. U. G. Weatherly of the Indiana University, and "Reasonable Restrictions upon the Scholar's Freedom" by President Henry Pritchett of the Carnegie Foundation, presented various aspects of freedom of teaching. There was held a joint session with the American Economic Association on the general subject, "The Relation of the State to Wages," with papers by Dr. Frank H. Dixon of Washington, D. C., and Mrs. Glendower Evans of the Massachusetts Minimum Wage Commission. See *Political Economy*, under ECONOMIC ASSOCIATION, AMERICAN.

SOCIOLOGY. Material of sociological interest will be found under many headings. Under

the article *LABOR* are cross references to numerous topics relating to phases of the labor problem. Under *SOCIAL ECONOMICS* is a list of articles treating social phases of industrial life. See also CHARITIES; EUGENICS; MARRIAGE AND DIVORCE; POLITICAL ECONOMY; SOCIOLOGICAL CONGRESS, ALABAMA; SOCIOLOGICAL CONGRESS, SOUTHERN; and SOCIOLOGICAL SOCIETY, AMERICAN.

Bibliography. W. H. R. Rivers, *Kinship and Social Organization*; R. G. Gettell, *Problems in Political Evolution*; John M. Mecklin, *Democracy and Race Friction*; M. A. Aldrich, and others, *Eugenics*; B. Eames, *Principles of Eugenics, a Practical Treatise*; H. F. Secretan, *La population et les mœurs*; E. W. Capen, *Sociological Progress in Mission Lands*; C. R. Henderson, *The Cause and Cure of Crime*. See also lists under *SOCIAL ECONOMICS*, and *POLITICAL ECONOMY*, and others there referred to.

SOILS. One of the most acute economic problems at the present time is the production of an adequate food supply at a reasonable price. This is essentially and fundamentally a soil problem. It is therefore encouraging to be able to record marked progress during the past year in the study of the possibilities of soils, and the means of increasing their productive capacity.

SOIL SURVEYS. As one of the most useful means to this end, soil surveys were extended and actively prosecuted in many parts of the world. Until the outbreak of the European War, systematic soil surveys were in progress in France, Germany, and Russia, and less complete surveys were being made in Australia, Japan, and South Africa. Recently the subject has begun to receive serious attention in the Philippines and in several of the South American countries, notably Argentina and Brazil. Probably the most comprehensive work of this kind continues to be that done by the Bureau of Soils of the U. S. Department of Agriculture. Some idea of the extent and character of this work may be gained from the fact that during the fiscal year, ended June 30, 1914, detailed soil surveys were completed or begun in 90 different areas located in 29 different States, and 35,721 square miles, or 22,861,440 acres, were surveyed. Reconnaissance surveys covering 11,129 square miles, or 7,122,560 acres, were also conducted in California and Wisconsin. The total area covered by the detailed surveys up to and including June 30, 1914, amounts to 329,539 square miles, or 210,904,960 acres, and by reconnaissance surveys, 434,049 square miles, or 277,791,360 acres. The detailed surveys are made on a scale of one inch to the mile, and the reconnaissance surveys on a scale of four miles to the inch. The surveys are in great demand by those interested in agricultural development, especially in case of the many areas where peculiar conditions of soil and climate exist, and where it seems necessary to introduce new crops or new methods for successful competition in the markets of the country.

During the past year a special study was made of the fruit and truck crop soils of the United States, the purpose being ultimately to furnish a complete guide to the soils best suited to these crops, and to indicate the proper methods of handling the soils.

Classification of the lands of the National forests with a view to release of those suitable for agricultural purposes (see *FORESTRY*), and sur-

veys of the lands of the various projects of the U. S. Reclamation Service with a view to their better utilization were continued.

SCIENTIFIC INVESTIGATIONS. Soil erosion is the cause of greater injury to agricultural lands than is often realized. The U. S. Bureau of Soils finds that in some Southern States as much as 50 per cent of the arable land is lost to agriculture from this cause. Effective methods of prevention and control, based on increasing the capacity of the soil to absorb water, or decreasing the velocity of the run-off, are being worked out. The problem of prevention of wind erosion and injury by shifting sands received considerable attention during the year, especially with reference to the sand dunes along the north coast of Europe, and much progress in reducing or controlling damage from this source and making such lands valuable for certain agricultural purposes is reported.

A simple method of determining the optimum water content of soils, based upon the rise of water by capillarity a short distance in a tube previously filled with dry soil, and the subsequent distribution of the water in the soil, is an important practical achievement of the Bureau of Soils during the past year.

In recent soil investigations much attention has been given to what has heretofore been considered minor or merely incidental constituents of soils, but which may prove to have an important bearing on soil fertility. For example, sulphur and manganese have been shown to be common constituents of soils, and there seems to be some direct correlation between their amount (within certain limits) and the fertility of the soil. Many of the rarer elements have been found to occur quite generally in soils, thus showing the great complexity of their mineral composition. A like complexity in the composition of the organic matter of soils is also revealed by recent investigations. The Bureau of Soils, alone, has isolated and identified more than 40 distinct compounds in the organic matter of the soil. The specific effects of these compounds on plant growth are being studied, with the result that some have been shown to be harmful while others are distinctly beneficial. Such work as this is fundamental to any correct understanding of soil fertility, replacing vague theories by definite knowledge.

Recent advances in the study of colloids have sharply emphasized the many and very intimate relations which exist between colloid bodies and the properties and processes of soils. Indeed, the great authority on colloids, Wolfgang Ostwald, declares that "soil is a conglomeration of colloids . . . soil physics is colloid chemistry."

A fact brought out by recent investigation, which may prove of great importance in the management of alkali soils, is that injurious soluble salts may be so combined that they mutually destroy each other's harmfulness. For example, C. B. Lipman has shown that it is possible "to triple and quadruple the total salt content of the soil and still make it a better medium for ammonification and nitrification than it was with one-third or one-fourth of the total salt content, consisting, however, of but one salt."

Much attention has been given recently to the matter of devising a simple and yet generally applicable system of soil classification. Several schemes of classification, one designed to be international in scope, were proposed during the year,

and one of the most recent treatises on soils, that of Glinka, is largely devoted to the subject.

Bibliography. Among the more important permanent contributions to the literature relating to soils which have recently appeared are—G. André, *Chimie Agricole—Chimie du Sol* (Paris, 1913); Mitscherlich, *Bodenkunde für Land-und Forstwirte* (Berlin, 1913); Russell, *Fertility of the Soil* (Cambridge, 1913); Wahnschaffe and Schucht, *Anleitung zur wissenschaftlichen Bodenuntersuchung* (Berlin, 1914); Glinka, *Die Typen der Bodenbildung, ihre Klassifikation und geographische Verbreitung* (Berlin, 1914); Case, *Coast Sand Dunes, Sand Spits, and Sand Wastes* (London, 1914); King, *Soil Management* (New York and London, 1914). Those interested in the public lands of the United States should secure from the Superintendent of Documents, Washington, D. C., *Price List 20, The Public Domain*, which gives a list of government documents relating to these lands.

SOLAR PHYSICS. See ASTRONOMY.

SOMALI COAST. See FRENCH SOMALI COAST.

SOMALILAND PROTECTORATE. A British protectorate established in 1884 under the administration of the India Office, transferred in 1898 to that of the Foreign Office, and again on April 1, 1905, to that of the Colonial Office. It lies on the Gulf of Aden, between the French and Italian dependencies, and borders on Abyssinia. The area is estimated at 68,000 square miles. Administration is limited to the coast belt. The population, mainly Mohammedan Somalis, is estimated at 300,000. They are for the most part nomadic, and grazing is the principal industry. Leading exports are hides and skins, sheep and cattle, gums, ostrich feathers, salt, ivory, and gold ingots. The imports consist mainly of rice, dates, cotton piece goods, iron, and hardware. Total imports in 1912-13, £249,529; 1911-12, £266,511; 1910-11, £267,183. Exports, 1912-13, £229,448; 1911-12, £240,036; 1910-11, £247,333. Grant-in-aid, 1912-13, £26,000. Revenue and expenditure, 1912-13, £29,913 and £60,872 respectively; 1911-12, £32,572 and £74,845. The principal towns are Berbera, Zeila, and Bulhar. Commissioner and Commander-in-chief in 1913, H. A. Byatt.

SOUTH, UNIVERSITY OF THE. An institution for higher education founded in 1851 at Sewanee, Tenn. It was open for instruction in 1868. The university comprises a college of arts and sciences and a theological department, the average number of students in both departments being 160, and there are about 20 members of the faculty. The productive funds amount to about \$400,000. The library contains about 35,000 volumes. The president is Albion Williamson Knight, D.D.

SOUTH AFRICA, UNION OF. A British colony; a legislative union, under one government, of four British provinces. The areas of the provinces, their total population, according to the census of May 7, 1911, and their total white population, are shown in the table of provinces and annexed territories below:

	Sq. m.	Pop. 1911	Whites
Cape of Good Hope ..	206,860	1,553,680	546,162
Bechuanaland	51,524	99,558	14,917

Total Union	473,100	5,973,894	1,276,242

Of the 1,276,242 whites, 591,078 were females; of the 4,019,006 natives, 1,996,067 were females; of the 678,146 other colored inhabitants, 316,867 were females. The proportion of Europeans in the total population, in 1904, was 21.58 per cent; in 1911, 21.37 per cent. The total non-European increase, from 1904 to 1911, was 15.72 per cent. The total increase for the union, from 1904 to 1911, of all races, was 15.41 per cent; for the Cape Province, 6.44 per cent; Natal, 7.69; Transvaal, 32.78; Orange Free State, 36.37. The density per square mile was 12.63 for the union, 9.26 for the Cape Province, 33.83 for Natal, 15.27 for the Transvaal, and 10.48 for the Orange Free State. The total population, in 1904, was 5,175,824. Cape Town, the capital, had 29,863 white inhabitants in 1911; Pretoria, 29,618; Johannesburg, 119,953; Durban, 31,783; Port Elizabeth, 18,190; Woodstock, 17,957; Germiston, 15,579; Maritzburg, 14,737; Bloemfontein, 14,720; Kimberley, 13,598; Krugersdorp, 13,132; East London, 12,279; Boksburg, 11,529.

MINING. The chief source of the country's wealth is the mining industry. Gold constitutes (1912) 60 per cent of the total exports, and diamonds over 15 per cent. The export of all minerals constitutes over 83 per cent of the total exports.

Gold. The total value of the gold output of the union, in 1912, was £38,691,688. The table below shows the output by provinces in 1911 and 1912:

	Fine ozs.		£	
	1911	1912	1911	1912
Transvaal	8,249,461	9,107,512	35,041,485	38,686,250
Natal	1,706	1,242	7,246	5,276
Cape	78	88	810	162
Total Union	8,251,240	9,108,792	35,049,041	38,691,688

The total output from the Transvaal for 1913 was valued at £37,358,040. Employed in the gold mines in December, 1912, were 24,558 white and 207,618 colored laborers, of whom 24,520 white and 207,456 colored were engaged in the Transvaal.

Diamonds. The value of the diamond output for the year 1912 was £10,061,489. The table below shows the output by provinces in 1911 and 1912:

	Carats		£	
	1911	1912	1911	1912
Transvaal	1,843,341	2,131,406	1,628,876	2,346,979
Cape	2,250,506	2,325,549	5,506,412	6,190,966
O. F. S.	798,152	614,927	1,611,436	1,488,544
Total Union	4,891,999	5,071,882	8,746,724	10,061,439

The stones obtained from the Transvaal mines are greatly inferior to those from the Cape and the Orange Free State, the latter selling at from

36 s. to 42 s. per carat when Transvaal diamonds were bringing only 13 s. per carat. Employed in the diamond mines, in December, 1912, were 8874 white and 52,369 colored laborers.

Coal. The total value of the coal output for the union, in 1912, was £1,999,378. The table below shows the output by provinces in 1911 and 1912.

	Tons *		£	
	1911	1912	1911	1912
Transvaal	4,348,680	4,751,850	1,020,539	1,044,986
Natal	2,679,551	2,765,068	725,448	771,755
O. F. S.	482,690	525,459	137,616	141,880
Cape	89,023	74,701	51,550	41,257

* Metric tons.

The Transvaal produced also 2960 tons of coke, valued at £3469; and 25,895 gallons of tar, valued at £806. Natal produced 5000 tons of coke, valued at £8511. The coal mines employed, in December, 1912, 1323 white and 23,277 colored laborers.

Other Minerals. The output of silver (1,017,013 fine ounces, valued at £124,374) is contained in gold bullion and base metal ores, there being no silver mines in the union. The output of copper (1620 tons of concentrates, valued at £49,142 from the Transvaal, and 16,951 tons of matte and ore, valued at £507,836 from the Cape) for the year 1912 was valued at £556,978. The output of tin ore (2932 tons, valued at £367,699) was all from the Transvaal. The output of lime in 1912 was valued at £129,470; salt, £63,096; asbestos, £18,882.

OTHER INDUSTRIES. In spite of the three years of severe drought, agricultural development has made great progress. The re-stocking of farms visited by the recent severe outbreaks of cattle fever proceeds rapidly. Irrigation plans are being carried out on a large scale in various districts. The wool export reached, in 1912, 162,000,000 pounds, valued at £4,780,000. The export of ostrich feathers was valued at £2,600,000.

The forest reserve covers 1,843,036 acres. The present annual importation of timber into the union is about 14,000,000 cubic feet, largely pine from Europe and America, with some hard wood from Australia. The total revenue from the forest reserve, during 1911, was £90,874; expenditure, £112,815.

COMMERCE. The total value of the imports and exports in the trade of the union, exclusive of specie, is shown in the table below, for three comparative years:

	1910	1911	1912
Imports	£36,727,367	£36,925,384	£38,838,960
Exports	53,609,340	57,024,000	62,974,219

A table of the principal imports for home consumption, and exports of domestic produce, in the 1912 trade, follows, values in thousands of pounds sterling.

Imports	1000£	Exports	1000£
Foodstuffs	6,859	Gold	38,842
Cotton mfrs.	8,237	Diamonds	9,153
Apparel	2,799	Wool	4,781
Hardware	1,812	Feathers	2,610
Leather mfrs.	1,686	Coal	1,162
Machinery	2,689	Hides & skins	1,691
Haberdashery	1,418	Mohair	967
Iron & steel	1,872	Copper	432
Wood, etc.	1,061	Bark	283
Drugs, etc.	950	Tin ore	346
Oils	725	Whale oil	151
Furniture	712	Fish	76
Glycerine	538	Fruit	60
Woolen mfrs.	925	Fodder	45

The United Kingdom contributed 58.1 per cent of the imports and received 91.4 per cent of the exports.

During 1912, 4106 vessels, of 12,205,300 tons net, were entered, and 4080 vessels, of 12,163,081 tons, were cleared.

COMMUNICATIONS. Previous to May, 1910, the State railways of the separate colonies, now constituting provinces of the union, were operated by their several governments. On that date these lines were amalgamated into one system under the name, The South African Railways, controlled by the central government. On Dec. 31, 1913, the mileage of the government lines totaled 8281, of which 7807 miles were of 3-foot, 6-inch gauge and 474 miles of 2-foot gauge, during the year the mileage having been increased 433, or approximately 5.5 per cent. In 1913 there was carried a total of 12,402,526 tons of revenue freight, including 6,985,832 tons of coal, these being increases of 634,928 tons and 461,997 tons, respectively. Although the total tonnage thus showed an increase of 5.58 per cent, the total freight revenue decreased 2.03 per cent, mainly because of rate deductions made in 1912. The total freight revenues were \$38,645,456, a decrease of \$801,125, and the coal revenues were \$9,208,190, a decrease of \$381,725. The revenues from passenger traffic in 1913 were \$16,447,173. This was an increase of \$335,524 over 1912, or 2.08 per cent, but compares with increases in 1912 over 1911 of 7.47 per cent, and 1913 over 1910 of 20.07 per cent. The gross earnings for the lines operated were \$60,333,237. The gross expenditures were \$43,668,040, thereby leaving a surplus of \$16,675,197 as compared with \$21,299,836 in 1912, and \$23,803,094 in 1911. The operating ratio was thus 72.36 per cent as compared with 64.97 per cent in 1913. The capital expenditure during the year being \$408,032,190, or \$48,856 per mile. The report states that when all the lines under construction at present are completed, the mileage operated by the South African Railways will be approximately 9318 miles.

The first train on the line from Prieska to Upington, ran over the road on November 16, and signified the completion of a rapid track-laying record. On September 9 track-laying on this line, 142 miles in length, was begun, and the entire work was completed in 68 days, a record, which though less than that held in the western United States, was the best to date for African railway construction. The line follows the Orange River almost its entire length, with very little earthwork to be done, and but three small water courses to be bridged. This line was constructed in order to facilitate the conduct of military operations in German Southwest Africa, and it was expected that the line would be extended to Kalfontein, the German railhead, for strategic reasons. The present terminus, Upington, is about 80 miles as the crow flies from the southeastern extremity of German Southwest Africa, and about twice that distance from the German railhead.

At the end of 1912 there were 15,236 miles of telegraph line, with 56,860 miles of wire. Telephone lines, 54,997 miles. Post and telegraph offices, 2644.

FINANCE AND GOVERNMENT. In the table below are shown revenue and expenditure for three comparative years:

	1911-12	1912-13	1913-14
Revenue	£17,284,847	£17,465,573	£15,889,000
Expenditure	16,603,693	17,204,126	16,419,264

The total public debt stood, March 31, 1912, at £117,769,676.

Viscount Gladstone of Lanark was Governor-General in the beginning of 1914, being succeeded later in the year by Viscount Buxton, who was assisted by the following Executive Council: Gen. L. Botha, Premier and Minister for Native Affairs; Gen. J. C. Smuts, finance and defense; Capt. H. Burton, railways and ports; N. J. de Wet, justice; Capt. H. C. van Heerden, agriculture; Capt. F. S. Malan, mines and instruction; * * *, interior; Sir Thomas Watt, public works, post, and telegraph; H. S. Theron, public lands; and Capt. J. A. C. Graaff, without portfolio. For other information, see articles under separate provinces.

HISTORY

DEPORTATION OF STRIKE LEADERS. Again in 1914 the Rand (or Witwatersrand, the famous gold-mining region in the Transvaal) was the scene of serious industrial disturbances (which will receive further treatment in the separate article on STRIKES) and the storm-centre of South African politics. A strike in this congested industrial community had been attended by bloody rioting on the terrible night of July 4, 1913, in Johannesburg, and had been terminated by the prompt intervention of the union government with martial law in one hand, and in the other promises to reinstate the strikers, to investigate their grievances, and to compensate the strike-breakers. But the situation still remained tense: the trade-unionists felt bitter resentment, and the Trades Federation still entertained the idea that by a sudden general strike it could bring the government to its knees. The signal for reopening the conflict was the decision of the government to carry out a policy of retrenchment in the administration of the State-owned railways, and to begin its economies by laying off some 70 railway-workers. On Jan. 7, 1914, a meeting of railway-workers was held at Pretoria; a railway strike was inaugurated the following day; and the strikers demanded the reinstatement of their 70 discharged fellow-workers. Instead of yielding, the government still further angered the strikers by giving protection to "scabs" and by arresting a number of strike leaders. By this time the Syndicalists in the Federation of Trades were so thoroughly excited that they issued the call for a general strike, January 13. Immediately the government proclaimed martial law, and mobilized 70,000 soldiers of the militia or Defense Forces; the strikers therefore found strong police guards everywhere, armed men watching the mines, and angry Boer militiamen patrolling the streets of Johannesburg. On January 16, a force of perhaps 5000 men surrounded the Johannesburg Trades Hall, a field gun was trained on the building, and the unarmed strike leaders within, composing the Executive Committee of the Trades Federation, were forced to surrender and escorted to jail by soldiers with fixed bayonets. Without leaders, the strike collapsed on January 22.

In its unhesitating and eminently successful efforts to prevent the advent of a new era of in-

dustrial anarchy in the Transvaal, the union government would have been generally commended by the middle classes, had it not committed one grave error, the deportation of the strike-leaders. At midnight on January 26, several days after all danger of an industrial crisis was past, nine of the most notorious labor agitators, who had been imprisoned at Johannesburg, were awakened from sleep, hustled aboard a train for Durban, and quietly but forcibly placed aboard the steamship *Umgent*. Despite their protests, and disregarding their demand for a legal trial, the unfortunate nine were conveyed by the *Umgent* to London.

Full opportunity for discussing the incident was given when on January 30 the South African Parliament was opened and (February 2) General Smuts introduced an Indemnity Bill exempting the public officials from punishment for any illegalities committed by them in suppressing the strike; there was also a clause declaring that the nine deported men should not be allowed to reënter the union. There had been a malign conspiracy of the Syndicalists, General Smuts declared, to terrorize the country; yet technically there was no law under which these criminals could be adequately punished; the government had therefore taken the law into its own hands in deporting the most dangerous conspirators without trial. This, however, constituted an alarming precedent for governmental interference with private liberties, and if it was admitted in principle that the government could deport citizens arbitrarily, the road would be clear to despotism. Such at least was the view of the ministry's critics. Mr. Creswell, the Labor leader, who had himself been imprisoned for promoting disaffection, not only denied that a conspiracy of the Syndicalists had existed, but went on to allege that the government had conspired with the mine-owners against the rights of labor, and that Gen. Louis Botha, the Boer Premier who had wielded arbitrary power in protecting the mine-owners, might well be called "Louis the First, By the Grace of God, Defender of the Mine Owners." But the majority in Parliament and the bulk of the middle classes in the country, while they were more or less disquieted by the deportations, were inclined to support the government, inasmuch as they believed the strike to have been caused by a small band of desperate Syndicalists, who tyrannized over the fairly well-paid white minority of workers on the Rand, and did not at all represent the needs of the real laboring class—the negroes. Moreover, there were a quarter of a million negro laborers in the Rand region, who might follow the lawless example of their white fellow-workmen; and insubordination of the great masses of subject negroes in South Africa, as well as in Britain's other African territories, might be the awful result of unchecked Syndicalist insurrections in the Transvaal. Probably it was this haunting spectre of a native uprising which induced the Parliament more readily to acquiesce in the deeds of a government which was at any rate firm in upholding order, if not exactly scrupulous about law. Consequently the Indemnity Bill was passed on third reading on March 10, and received the assent of the Governor-General nine days later. In the Transvaal, however, the incident tended to strengthen the Labor party, as was shown by the election of a Labor majority to the Transvaal Provincial Council. In

passing, it is interesting to note that the newly elected Labor majority in the Transvaal Council, being unable to control the policy of the Administrator and his executive, attempted to transfer his powers to select committees of the Council by ordinances which were subsequently disallowed under the South African Act as *ultra vires*.

Meanwhile Imperial complications developed. The nine deported workmen, arriving off Gravesend, England, on February 24, were received with open arms by their Laborite sympathizers in the mother country. Their recital of General Botha's misdeeds aroused such indignation that a huge mass meeting in Hyde Park on March 1, and Socialist meetings in other British cities, voiced a vehement protest against the harsh policy of the South African government as well as against the indifference of Mr. Asquith's ministry in refusing to intervene. The Imperial government, it must be remembered, possessing the constitutional right to disallow any bill of the Union Parliament, might constitutionally have vetoed the Indemnity Bill and protected the deported strikers. But in so doing, the Imperial government might have angered General Botha, who by resigning would throw the South African government out of gear. Therefore nothing was done; although the announcement in February that Sydney Buxton, an energetic Liberal, hitherto on the Board of Trade, would succeed Lord Gladstone as Governor-General of South Africa, was taken in some quarters to indicate a rebuke to the stern industrial policies of the government with which Lord Gladstone as Governor-General had been connected.

UNION PARLIAMENT AND LABOR. Owing chiefly to the controversy over the deportations, the session of the Union Parliament, which lasted from January 30 to July 7, was the longest in the history of the union, despite the introduction of the closure as a means to expedite parliamentary procedure. Besides the budget, which involved important tariff changes and proposals for the taxation of incomes and undeveloped lands, the session was mostly concerned with measures affecting industrial conditions. The Indemnity Bill has been sufficiently discussed. A Peace Preservation Bill, endowing the government with the most sweeping powers for the suppression of industrial disorders, was so violently assailed that for it a somewhat milder Riotous Assemblies Bill was substituted and passed, which latter prohibited all forms of "peaceful picketing," penalized the intimidation of workmen, and provided penalties for persons who broke their contract of employment in the public utilities. The act also empowered the government to deport any persons convicted of high treason, sedition, or public violence. With the intention of punishing the men who went out on strike in January, the government introduced a Railways Strike Bill, assigning modest rewards to the employees who had held aloof from the strike, and imposing rather heavy fines on those who had participated; owing to the pressure of public opinion, however, the fines had to be abandoned. It remains to mention several measures which were designed to alleviate some of the grave industrial maladies of which strikes and riots were symptomatic. Late in 1913, in fulfillment of its promise given to the labor delegates in July, 1913, the ministry had

published a number of bills which it proposed to bring in the following year—bills dealing with Workmen's Compensation, Factories, Industrial Disputes, and Trade Unions. But when the time came to open the parliamentary session of 1914, the ministry announced that these measures would be shelved, inasmuch as "the country has been profoundly stirred by the recent disorders (the January strike), and the feelings which have been aroused must be allowed to subside before the problems which have presented themselves as the outcome of these events can be calmly reviewed and wisely dealt with." But as the anticipated short session lengthened out, and the Opposition became increasingly insistent, General Botha's cabinet finally consented to bring up for consideration (1) a bill regarding Industrial Disputes and Trade Unions, (2) a Workmen's Compensation Bill. The former bill, which provided for compulsory investigation of industrial disputes and established commissioners for conciliation, was opposed by the Laborites because it restricted the liberty of striking, and was lost in the congestion of business at the close of the session. The second bill was successfully passed. Frankly following the form of the English Act of 1906, and adopting the scale of compensation in vogue in the Transvaal, the Workmen's Compensation Act supplemented and consolidated the defective and variant compensation laws of the several provinces, and made it possible for practically all classes of labor (except domestic and agricultural workers not in charge of machinery) to claim legal compensation for industrial accidents. Another sorely needed measure was the Workmen's Wages Protection Act, borrowed from West Australia, which made his workmen's wages the first charge upon the moneys received by any contractor for building or other work. Nor must we forget the Amending Bill which was passed late in the session to supplement the Miners' Phthisis Act of 1912: men who worked at stone crushing machines above ground were now included as "miners"; native miners, who frequently succumb to the dread disease unawares, were to be compulsorily examined by medical inspectors twice a year; and the maximum compensation payable to a miner in the first stages of consumption was increased from the insufficient £96 to a more generous £200.

SETTLEMENT OF THE INDIAN QUESTION. By relieving the grievances of the resentful Indian immigrants, the South African government removed a most serious cause of discontent. In accordance with the report of the Solomon commission (consult 1913 YEAR BOOK, p. 644), which was published March 17, 1914, the ministry put through an Indians Relief bill (1) to repeal the £3 tax on ex-indentured Indians in Natal, and (2) to give legal status to the *de facto* monogamous marriages of Indian immigrants, although such marriages were solemnized according to the rite of a religion which sanctioned polygamy. Some of the Mohammedans thought the marriage provisions too restrictive, but the preponderant mass of Indian communities both in South Africa and India were inclined to accept these concessions as a definite settlement, especially after General Smuts publicly promised to adopt a conciliatory policy in administering the laws, on condition that they should "constitute a complete and final settlement of the contro-

versy . . . and be accepted as such by the Indian community." Mr. Ghandi, who led the "passive resistance" movement last year, declared that the Indians still remained under serious disabilities with regard to rights of trade, residence, and land ownership, and was certain that "complete satisfaction cannot be expected until full civic rights have been conceded to the resident Indian community." Nevertheless he accepted the settlement as a basis for amicable relations, and, as if to signalize the fulfillment of his mission in South Africa, Mr. Ghandi returned to India amidst the plaudits of his race.

BOER REVOLT. The resentment which the Boers were supposed still to cherish against their British conquerors, and the prevalence of acute industrial unrest as evidenced in the recent strikes, afforded some foundation for the belief that in the War of the Nations, South Africa would either be positively disloyal to the British Empire, or at least would be prevented by intestine strife from furnishing aid to the mother country. For a time the actual course of events bade fair to challenge this pessimistic conclusion. Premier Botha, who had once borne arms against Great Britain, pledged his unfaltering loyalty, September 10. Three days later the Union Parliament confirmed the assurance of South Africa's intention to stand by the Empire. The Imperial troops were withdrawn, and the Defense Forces of the Union left in charge. South African troops were sent to invade German South West Africa and occupied Lüderitz Bay, September 19. The first alarming symptom was the resignation, on September 21, of Brig.-Gen. Christian F. Beyers, commanding general of the Union, because he disapproved of the attack on the German colony. But General Botha, assuming command in person, continued the campaign. In October the standard of revolt was raised by Lieut.-Col. Solomon G. Maritz in the northwest corner of Cape Province. Eighty of his men were captured on October 15; 73 more on October 19; on October 22 Maritz was repulsed in an attack on Keimos; and on October 26 the government announced that he had been driven in defeat across the border into German territory. The following day, the government regretfully reported the rise of a far more serious rebellion. General Christian de Wet, who had commanded the Free State forces in the South African War, called on his followers in the north of Orange Free State to rise against the government; simultaneously a rebellion was begun in the Transvaal by Gen. Christian Beyers, another of the Boer leaders who had played a conspicuous rôle in the war of the Boers against Great Britain (1899-1902), and had recently resigned the chief command of the Citizen Defense Forces of the Union. The Boers who once had fought so stubbornly to preserve their independence against Great Britain were now arrayed on opposite sides, some supporting General Botha's attitude of loyalty to the Empire, and a minority sympathizing with the rebellion. Reports from English sources gave General Botha credit for a series of victories; on October 28 he captured 80 of Beyers' men; on October 29, 124 rebels surrendered, and on October 30, 100. On November 1 the rebels were defeated in Lichtenburg district of the Transvaal, losing 13 killed, 30 wounded, and 240 captured. On November 6

General Muller, another rebel, lost 58 men in a defeat at Bronkhorstspuit, 34 miles east of Pretoria. On November 8 General Beyers lost 364 men in an engagement southeast of Bloemhof. On November 8 a mixed force of Germans and Boers was defeated at Zandfontein in German Southwest Africa with a loss of 120 killed and wounded and 25 captured. On November 12 General Botha defeated De Wet, 24 miles east of Winburg (Orange Free State) and made 250 prisoners. A week later General Botha was able to report that De Wet's forces were being rapidly dispersed. De Wet himself was captured on December 1, near Mafeking and imprisoned in the fort at Johannesburg. General Beyers was shot a few days later, while fording the Vaal River. On December 10, the Premier announced that since the capture on December 4 of 700 rebels and the surrender of 200 more, five rebel leaders had capitulated and only one—Colonel Maritz—remained at large. On December 22, the Minister of Justice declared that 4000 ex-rebels were now in prison, and 1000 on parole. The rebellion was not completely crushed, however, for on December 22, Colonel Maritz reappeared at the head of 800 men and defeated the union forces at Schnitdrift, taking 90 prisoners. See **STRIKES; WAR OF THE NATIONS.**

SOUTH AMERICA. See various South American countries, also **EXPLORATION, South America.**

SOUTH AUSTRALIA. A State of the Commonwealth of Australia. The estimated area is 380,070 square miles. The census of April 3, 1911, returned a population of 408,558, exclusive of full-blooded aboriginals; estimate of Dec. 31, 1912, 430,090. The capital is Adelaide, whose population, with suburbs, was 189,646 in 1911.

According to the annual report of the Railway Administration for South Australia, the mileage of State railways on June 30, 1914, was 1845; of this 1052 miles were of 3-foot, 6-inch gauge, or 85 miles more than on June 30, 1914, and 793 miles were of 5-foot, 3-inch gauge, 70 miles having been added during the year. There are authorized or in course of construction 463 miles. Also, under agreement with the Australian government, an additional 478 miles of 3-foot, 6-inch gauge railway are operated from Port Augusta north to Oodnadatta almost on the Northern Territory line. The total earnings, for the fiscal year ended June 30, 1914, exclusive of the branch which is mentioned, were \$11,349,040, of which \$3,657,067 was passenger train revenue, \$7,456,149 freight train revenue, including \$3,125,649 for the transportation of minerals, and \$245,775 of miscellaneous revenue. In all items of traffic except wheat and live stock an increase over 1913 was shown, and the total earnings, \$558,001 greater, constituted a new record, while there was also an increase in total expenditures. The net revenue \$4,042,772 was equal to 5.33 per cent on a capital expenditure of \$75,812,740 on average mileage open. From this net revenue there were deducted interest charges of \$2,753,175 chargeable to the railways by the government rate of 3% per cent. The South Australian railways in 1914 carried 19,809,533 passengers, an average distance of 11.95 miles. The total revenue freight tonnage was 15,082,769, and the total earnings per mile were \$6250.

In March, 1914, Admiral Sir Day Bosanquet, who had been Governor of South Australia since March, 1909, was succeeded by Lieut.-Col. Sir

Henry Lionel Galway. Lieutenant-Governor (from 1891) and Chief Justice, Sir Samuel James Way; Premier (from February, 1912), Archibald Henry Peake. In the parliamentary session which opened on July 6, 1914, no important business was transacted other than the enactment of such measures as price regulation which are customary in war time. See **AUSTRALIA.**

SOUTH CAROLINA. POPULATION. The estimated population on July 1, 1914, was 1,590,015. The population in 1910 was 1,515,400.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acres	Prod. bu.	Value
Corn1914	1,975,000	36,538,000	\$38,615,000
1913	1,975,000	38,512,000	37,357,000
Wheat1914	80,000	920,000	1,834,000
1913	79,000	972,000	1,264,000

1913	2,790,000	1,378,000	83,541,000

a Tons.
b Pounds.
c Bales.

MINERAL PRODUCTION. Up to the close of 1911 the most important mining industry in the State was that of phosphate rock. In 1912, owing to a decrease in the production of this material and an increase in the value of the clay products, the phosphate-mining industry gave way to clay working as first in rank. The production of phosphate rock continued to decrease in 1913, and although there was also a decrease in the value of the clay products, the latter still maintains first place. In 1913 the production of phosphate rock was 109,333 long tons, valued at \$440,588, a decrease of 22,157 long tons, and of \$84,172 over 1912. The clay products in 1913 were valued at \$583,241, compared with \$704,563 in 1912. South Carolina is one of the four States which produces a peculiar quality of clay used in the paper trade and known as "paper clay," and the production of this clay in 1913 was 31,568 tons, valued at \$120,520. South Carolina is one of two States, North Carolina being the other, in which monazite has been produced in commercial quantities, but since 1910, on account of the heavy importations from Brazil, the production in both States has practically ceased. The mining of gold in South Carolina, once of some considerable importance, has now almost entirely ceased, as in 1913 there was produced but 236 fine ounces, valued at \$4881. Other commercial substances produced are barytes, fuller's earth, occasional gems, lime, manganese ore, mica, mineral waters, sand and gravel, silver, stone, and tin. The total value of the mineral products decreased from \$1,606,989 in 1912 to \$1,464,150 in 1913.

FINANCE. The report of the State Treasurer for the fiscal year 1914, shows a balance on hand Dec. 31, 1913, of \$738,634. The total receipts

for the period amounted to \$3,128,557 and the total expenditures to \$3,514,472, leaving a cash balance on Dec. 31, 1914, of \$352,718. The public debt of the State on Dec. 31, 1914, amounted to \$5,675,851.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State include the South Carolina Industrial School for White Boys at Florence; South Carolina Institute for the Deaf, Dumb, and Blind at Cedar Springs; the Penitentiary at Columbia; and the Hospital for the Insane at Columbia.

EDUCATION. There were enrolled in the public schools of the State in 1913, 361,161 pupils. Of these, white pupils numbered 167,914 and colored 193,247, the average daily attendance of white pupils being 110,148 and of colored 128,020, or for both 238,168. The white women teachers numbered 3807 and the white male teachers 777. Of colored female teachers there were 2101, and of colored male teachers 773. The average salary for white male teachers was \$530.28, and for white women teachers \$302.48, while for colored teachers the average yearly salary for male teachers was \$126.87, and for women, \$123.90.

TRANSPORTATION. The total miles of all tracks in South Carolina on June 30, 1914, was 4594, and of this about 185 miles were electric railways. There were constructed during the year about 26 miles of steam railroad and 31 miles of electric interurban lines. The roads having the longest mileage in the State are the Southern Railway, 1472; Atlantic Coast Line Railroad, 1158; Seaboard Air Line Railway, 446; Charleston and Western Railway, 389; and the Carolina, Atlantic, and Western Railway, 208.

POLITICS AND GOVERNMENT. The State Legislature met in its annual session in 1914, but the measures passed were chiefly of local interest and importance. Elections were held during the year for Governor and State officers, representatives in Congress, and United States Senator. Senator Ellison D. Smith, whose term expired on March 4, 1915, was a candidate for reelection, having for his opponent Governor Blease. After an unusually bitter campaign, Senator Smith was, in the primaries held on August 25, renominated. On September 8, a second primary was held to nominate a Governor, and Richard I. Manning was successful in receiving the Democratic nomination, which, in South Carolina, is equivalent to an election. His only opponent was the Socialist candidate, R. B. Britton. In the elections of November 3, Mr. Manning was elected Governor by 34,606 votes, the Socialist candidate receiving only 83 votes. Senator Smith was elected Senator with practically no opposition. The total vote cast in this election was 34,689, compared with a vote of 50,348 in the presidential election of 1912. There was no particular significance in the falling off of the vote as the Democratic party is practically the only one in the State. Governor Blease continued the notoriety, which followed him throughout his term, by his wordy wars with the Legislature and by the wholesale pardoning of State prisoners. At the expiration of his term he had set free more than 3000 prisoners as a protest against the prison laws of the State.

STATE GOVERNMENT, 1915. Governor, Richard I. Manning; Lieutenant-Governor, Andrew J.

Betha; Secretary of State, R. M. McCown; Attorney-General, Thos. H. Peebles; Treasurer, S. T. Carter; Comptroller-General, A. W. Jones; Superintendent of Education, John E. Swearingen; Adjutant-General, W. W. Moore; Commissioner of Agriculture, E. J. Watson; Commissioner of Insurance, F. H. McMaster—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Eugene B. Gary; Justices, D. E. Hydrick, R. C. Watts, Thos. B. Fraser, and Geo. W. Gage; Clerk, U. R. Brooks—all Democrats.

..... 1913	460,000	552,000	3,588,000

a Tons.

MINERAL PRODUCTION. Gold is practically the only mineral of importance produced in South Dakota, the greater part of it coming from the Homestake mine. The mine production in 1913 was valued at \$7,319,294, which was \$572,076 less than the record yield of \$7,891,370 in 1912. The silver production fell from 206,460 ounces in 1912, to 172,702 ounces in 1913. The production of gold from the mines of the State in 1914, according to the estimates of the United States Geological Survey, was \$7,270,000, compared with \$7,319,294 in 1913. The production of silver was approximately 174,000 ounces, compared with 172,702 ounces in 1913. A nominal quantity of lead and copper was produced. The total value of the mineral products of South Dakota in 1913 was \$7,888,411, compared with \$8,436,240 in 1912.

FINANCE. The report of the State Treasurer shows cash on hand on July 1, 1913, amounting to \$925,135. The total receipts for the year amounted to \$4,337,928, and the disbursements to \$4,444,939, leaving cash on hand, June 30, 1914, amounting to \$818,123.

TRANSPORTATION. The total railway mileage in the State in 1914 was 4240, about 30 miles of new road being constructed during the year. The roads having the longest mileage are the Chicago, Milwaukee and St. Paul, 1794; Chicago and North Western, 1063; Milwaukee and St. Louis, 269; and the Great Northern, 262.

EDUCATION. The total school population of rural districts on June 30, 1914, was 119,012;

in independent districts there were 51,862. The total enrollment of pupils below high school grade was 87,206 for the rural districts and 33,521 for independent districts. In the high schools there were enrolled in the rural districts 1680 and in the independent districts 8405. The average monthly salary of male teachers in the rural districts was \$56.55 and of female teachers \$51.08. In the independent districts the average monthly salary for male teachers was \$108.35 and for female teachers \$63.41. The total number of schoolhouses in the rural districts was 4943 and in the independent districts 274. The expenditure for the school year in the rural districts was \$3,209,892 and in the independent districts \$2,203,171.

CHARITIES AND CORRECTIONS. The institutions under the control of the State Board of Charities and Corrections include the Penitentiary and State School for Deaf Mutes at Sioux Falls, State Training School at Plankinton, State Hospital for the Insane at Yankton, State School for the Blind at Gary, State School and Home for the Feeble-Minded at Redfield, and the State Tuberculosis Sanatorium at Custer.

POLITICS AND GOVERNMENT. The Legislature did not meet in 1914, as the sessions are biennial, and the last was held in 1913. Elections were held for Governor and for United States Senator. Governor Byrne, Republican, was a candidate for renomination, and Senator Crawford, whose term expired on March 4, 1915, was also a candidate to succeed himself in the Senate, being opposed by C. H. Burke, a member of Congress. Nominating elections were held on March 24, and Governor Byrne was renominated, but Senator Crawford was defeated for the nomination by Mr. Burke, the Democratic nominee for Senator being E. S. Johnson. In the elections of November 3, Governor Byrne was reelected, receiving 49,138 votes, compared with 34,542 for McCarter, Democrat, and 9725 for Richards, Independent. The Democratic candidate for the Senate, Mr. Johnson, was elected, receiving 48,076 votes, compared with 44,244 for Burke, Republican, and 2874 for E. P. Johnson, Socialist. The total vote cast in the election was 981,141, compared with 116,325 in the presidential election of 1912. Comparisons, however, are not possible because there were no Republican electors voted for in 1912, and the Progressives had no nominees in 1914. The Republicans elected representatives in all three districts of the State.

STATE GOVERNMENT, 1915. Governor, Frank M. Byrne; Lieutenant-Governor, Peter Norbeck; Secretary of State, Frank M. Rood; Treasurer, A. W. Ewert; Superintendent Instruction, Chas. H. Lugg; State Land Commissioner, Fred. Hepperle; Attorney-General, C. C. Caldwell; State Auditor, J. E. Handlin—all Republicans.

JUDICIARY. Supreme Court: Presiding Judge, James H. McCoy; Justices, Charles S. Whiting, John Howard Gates, Samuel C. Polley and ———— all Republicans.

STATE LEGISLATURE, 1915.

	Senate	House	Joint Ballot
Republicans	34	80	114
Democrats	11	20	31
Republican majority	23	60	83

The representatives in Congress will be found in the article UNITED STATES, section Congress.

SOUTH DAKOTA, UNIVERSITY OF. A State university of higher education, founded at Vermillion in 1882. The number of students enrolled in the several departments of the university in the autumn of 1914 was 400, and the faculty numbered 50. There were no notable changes in the faculty during the year and no noteworthy benefactions were received. The annual income of the university is \$130,500, most of which is derived from the State Legislature. The library contains about 20,500 volumes. The president is Franklin P. Gault, Ph.D.

SOUTHERN NIGERIA. See NIGERIA.

SOUTHERN SOCIOLOGICAL CONGRESS.

See SOCIOLOGICAL CONGRESS, SOUTHERN.

SOUTH GEORGIA. Island dependencies of the Falkland Islands (q.v.).

SOUTH ORKNEY ISLANDS. A dependency of the Falkland Islands (q.v.).

Total	504,517 †	19,611,334

* With Ceuta.

† 194,794 square miles.

The greatest density per square kilometer is found in Biscaya—162, and the least density in

Huesca and Cuenca, with 16; the mean density for the kingdom is 40. The number of marriages in 1912 was 142,897, births 637,901, and deaths 426,269. Emigrants in 1912, 194,443—147,640 to Argentina, 29,386 to Cuba, and 9641 to Brazil. According to the census of 1910, the communal population of Madrid was 599,887, Barcelona 587,411, Valencia 233,348, Seville 158,287, Málaga 136,365, Murcia, 125,957, Saragossa 111,704, Carthagena 102,519, Bilbao 93,536, Granada 80,511, Lorca 72,795, Valladolid 71,066, Palma (Balears) 67,544, Cádiz 67,174, Córdoba 66,004, Jerez de la Frontera 61,250, Las Palmas 60,338, Alicante 55,300, Gijón 55,088, Oviedo 53,269, Badajoz 35,039.

PRODUCTION. The soil is fertile, but 60 per cent of the area is uncultivated, though 79.65 per cent is returned as "productive." Tropical fruits thrive, and Spain is the second largest producer of olives in the world, Italy ranking first. The vine is grown in all the provinces, sherry and tent wines coming from Jerez, malaga and alicante from the southeast. In the table below are shown areas under main crops and yield in metric quintals for two years (figures for 1913-14 subject to revision), with yield per hectare in 1912-13:

	Hectares	Quintals	Qc.
	1912-13	1913-14	1912-13
Wheat	3,902,925	3,904,169	80,590,794
Rye	776,172	766,278	7,091,144
Barley	1,565,940	1,835,470	14,973,469
Oats	546,682	512,700	3,677,145

Beets	43,100	35,000	10,800,000
Vines†	1,250,160	1,250,160	17,105,203
Olives†	1,452,898	1,453,000	2,654,225

* Fibre.

† Production in hectoliters.

Live stock in 1912 numbered 525,853 horses, 928,920 mules, 829,410 asses, 2,561,894 cattle, 15,829,954 sheep, 3,116,226 goats, 2,571,359 swine. Sericulture is carried on in Valencia, Murcia, and other provinces.

The mining industries in 1911 employed 112,142 male and 5361 female workers, of whom 15,821 were boys and 1706 girls under 18 years of age. Amount of copper output 1911, 3,284,184 metric tons valued at 35,654,223 pesetas; iron, 8,773,691 tons and 47,599,172 pesetas; coal, 3,454,394 and 47,690,363; lead, 163,843 and 27,620,683; argentiferous lead, 156,569 and 24,575,689; mercury, 19,940 and 3,527,003; zinc, 162,140 and 6,742,493; anthracite, 209,227 and 3,321,092; lignite, 252,051 and 3,057,237, etc.

There are factories for the manufacture of cotton goods, woolen goods, paper, glass, corks, etc. The value of the fisheries products is estimated at about 60,000,000 pesetas annually.

COMMERCE AND COMMUNICATION. Imports for home consumption and exports of domestic produce are given in the table below for three years in pesetas:

	1910	1911	1912
Imports	1,000,086,564	993,682,238	1,140,651,000
Exports	970,519,855	961,969,810	1,145,992,000

Imports and exports for 1912 are given as 1,140,651,000 and 1,145,992,000 pesetas respectively; for 1913, special trade, as 1,173,105,000 and 1,078,350,000. The details by principal countries of origin and destination in 1911 and

1912 are shown in the table below in thousands of pesetas:

	Imports		Exports	
	1911	1912	1911	1912
United Kingdom	168,422	200,585	286,512	286,229
France	164,351	182,958	280,707	257,681
Germany	128,521	183,329	61,044	74,389
United States	129,662	155,232	57,812	67,312
Cuba	1,798	3,451	54,547	68,648
Porto Rico	6,000	6,664	3,587	3,057
Philippine Islands	14,825	18,993	6,729	8,430
Morocco	6,181	5,822	4,821	6,178

There were entered at the ports in the 1912 trade 21,711 vessels, of 22,668,000 tons, and in 1913, 22,296 vessels, of 25,403,827 tons; cleared, 1912, 19,051, of 22,045,000 tons, and 1913, 19,185 vessels, of 23,942,643 tons. The merchant marine included Jan. 1, 1913, 596 steamers, of 761,281 tons net, and 301 sailing vessels, of 44,325.

Spanish railways are operated by private companies, nearly all under guarantees or subventions from the government. Total railways in operation Jan. 1, 1912, 14,805 kilometers. Telegraph lines, 42,935 kilometers with 93,495 kilometers of wires; telegraph stations, 1956, of which 1118 are State. Post offices, 6041.

FINANCE. The unit of value is the peseta, par value 19.295 cents. In the table below are given revenue and expenditure for three years in pesetas:

	1911	1912	1913
Revenue	1,181,458,000	1,181,435,000	1,505,228,000
Expend.	1,045,865,000	1,162,858,000	1,519,228,000

The details of the 1914 budget are given below in thousands of pesetas:

Revenue	1000Ps.	Expenditure	1000 Ps.
Direct taxes on land, trade, government salaries, registration, etc.	484,409	Administration	12,044,079

* Campaign.

The total public debt stood Jan. 1, 1913, at 9,941,918,985 pesetas; Jan. 1, 1914, 9,973,485,962 pesetas.

ARMY. The law of June 29, 1911, prescribed personal obligatory service for all Spaniards

with a few special exceptions. Recruits called for service are divided into two groups, in which the first is scheduled to receive three years' service with the colors, but in practice only two years, while the others receive less than one year's training. Service in the active army is followed by five years in the second portion, six years in the reserve and the remainder of the time of liability in the territorial reserve. The most recent figures available in 1914 gave the effectives of the permanent army as 123,000, its second line as 260,000, the reserve 290,000, and the territorial reserve about 500,000. The infantry is furnished with the Mauser rifle, and the field artillery with the Creusot quick firing gun.

NAVY. The act of Jan. 7, 1908, provides for 3 battleships: the *España*, launched Feb. 5, 1912; the *Alfonso III*, launched May 8, 1913; the third begun Oct. 2, 1911—building at Ferrol. The *España* completed her trials September, 1913; she has a displacement of 15,460 tons and carries 8 12-inch and 20 4-inch guns. Also building are 4 gunboats, of 800 tons, and 3 destroyers, of 370—all at Cartagena; and 24 torpedo boats for coastal service. The number of warships built and building in October, 1913, was as follows: 1 second-class battleship (9890 tons), 3 first-class protected cruisers (25,133), 1 second-class (5871), and 2 third-class (4083), 4 torpedo-boat destroyers (1845), 1 torpedo boat (127) of the first, and 4 (284) of the second-class, 8 first-class gunboats (6925) and 8 second- and third-class (3203)—all built.

A new programme is under consideration which would include 3 new dreadnoughts, 2 scouts, 8 destroyers, besides torpedo boats and submarines.

GOVERNMENT. The constitution vests the executive authority in the king acting through a responsible cabinet of ministers appointed by himself. The Cortes, conjointly with the king, exercises the legislative power. There are two houses—a senate of 360 members, partly hereditary, partly appointive, and partly elective, and a congress of deputies of 431 elective members. Reigning sovereign 1914, Alfonso XIII, born May 17, 1886. He married May 31, 1906, Princess Victoria Eugenie of Battenberg. Heir-apparent Prince Alfonso, born May 10, 1907. The council of ministers as constituted Oct. 27, 1913, was composed as follows: E. Dato, premier; Marques del Vadillo, justice; Marques del Lema, foreign affairs; Lieutenant-Colonel (Conde) del Serrallo, war; Vice-Admiral A. Miranda, marine; Conde de Bugalal, finance; J. Sánchez Guerra, interior; F. Bergamín, instruction; J. Ugarte, agriculture.

HISTORY

DATO CABINET AND THE GENERAL ELECTION. The Dato ministry, which had come into power in October, 1913, as a result of the dissensions among the Liberals on the question of regional decentralization, was Conservative in name, but in policy not much different from the Liberalism of Count Romanones. The Regional Decentralization (Mancomunidades) Bill (see the YEAR BOOK for 1913) which had wrecked the Romanones cabinet, was taken up by Premier Dato and on December 18 the Conservative government issued a provisional decree giving ef-

fect to the vital principle of the bill, allowing municipalities and provinces voluntarily to group themselves in regional associations for administrative purposes. The Dato cabinet not only owed its origin to a party schism among the Liberals; it was also bound up with a division of the Conservative party. Señor Maura, leader of the old-line Conservatives, who had played such a mysterious rôle at the formation of the Dato cabinet, soon took up a position of open antagonism to the Liberalizing tendencies of Señor Dato, so that, when a general election was held in the spring of 1914, the Maura Conservatives and the Dato Liberal-Conservatives appeared as almost distinct parties. The election of the Chamber of Deputies, March 8, resulted in a notable victory for the Conservatives of Liberal persuasion, the party representation being as follows: Maurist Conservatives, 10; Jaimists, 16; Dato Conservatives, 235; Romanones Liberals, 80; Prieto Liberals, 30; Reformist Republicans, 12; Republican Socialists, 21; Lerroux Radicals, 4—a brilliant victory for the liberal monarchy against both reactionaries and revolutionaries. To the Senate were elected, on March 22: 92 Conservatives, 51 Liberals, 9 Democrats, 7 Republicans, 3 Reformists, 4 Independents, 6 Regionalists, 3 Carlists, 1 Integrist, 1 Catholic, 1 Agrarian. The newly elected Cortes met on April 2. The Speech from the Throne contained two notable passages: one declaring the intention of the government to maintain friendly relations with the Vatican; the other emphasizing the cordiality of relations with France and Great Britain. During the debate on the Address in Reply to the Speech from the Throne, the leader of the Maurists in the Senate, Rodríguez San Pedro, declared that he and his followers would not support Sr. Dato. The premier retorted that he would remain in office whether the Maurist Conservatives were satisfied or not. Thereupon the Address was passed with a majority of 74 for the government.

NAVY ESTIMATES. In May, Count Bugalal read the general estimates for 1915, which showed an increase of \$12,500,000 over the previous year, and revealed a deficit of nearly \$20,000,000 to be met by an issue of treasury bonds. Notwithstanding this unfavorable financial situation, the government formulated a programme of naval construction involving the expenditure of 36,000,000 pesetas (about \$7,000,000) a year for the next nine years. A battleship costing 70,000,000 pesetas was to be launched in 1917; another battleship was to be laid down in 1917; a fast cruiser of 1000 tons, costing some 4,500,000 pesetas, was to be commissioned in 1917; a similar cruiser was to be begun in 1917; and three submarines, costing 300,000 pesetas apiece, were scheduled for 1918. The work was to be done in Spanish shipyards at Cartagena and Ferrol by British shipbuilding firms.

MISCELLANEOUS. In May, the Infante Ferdinand obtained permission to marry (in October) Donna Luisa Silva Fernandez Henestro, daughter of Count Pius de Concha. On October 24 a sixth child was born to Alfonso XIII. The Rio Tinto strike was settled in January by arbitration. (See STRIKES.) A block of model workingmen's dwellings was erected at Seville, by a private donation of \$100,000, plus contributions from the King, the government, and the municipality. In the War of the Nations, Spain

remained rigidly neutral, although on the one hand her recent *rapprochement* with France and Great Britain might have been expected to draw her into the war, and although on the other hand, rumor credited Germany with offering Spain French Morocco as the price of military support. As Ambassador to France the Marquis de Valtierra succeeded the Marquis de Villa Urrutia early in September. Don Jaime, the Bourbon Pretender, was said to have been expelled from his castle at Frohsdorf, in Austria, because of his strong anti-German sympathies. The reported shooting of five Spaniards at Liège caused a certain amount of popular excitement, although the German government promised the Spanish ambassador that if the report should be confirmed, Germany would be willing to make satisfactory reparation. See also INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties.

SPANISH LITERATURE. The official statistics for Spanish literature in 1914 not having yet appeared, it is impossible to say whether it has been more, or less, prolific than in recent years; but in any case it seems safe to say that it has been on the whole less satisfactory. The old favorites have been less in evidence, and there has been astonishingly little that is really extraordinary. That does not mean, however, that the year has been uninteresting, nor that literature, whether creative or scholarly, has been neglected.

LITERARY CRITICISM, despite its tremendous losses by death in the past few years, still flourishes, as witness the following: Azorín, *Los valores literarios* (keen essays concerning the values of certain moderns and classics); Antonio J. Bastinos (with Teodoro Baró and Ramón Pomés), *Arte dramático español contemporáneo*; A. Bonilla y San Martín, *Marcelino Menéndez y Pelayo (1856-1912)*; A. Calvet, *Fray Anselmo Turmeda, Heterodoxo español*; J. Cascales Muñoz, *José de Espronceda: su época, su vida y sus obras* (biographico-critical study, and revolutionary in its claims); L. Coloma, *Fray Francisco* (an historical biography of Cardinal Cisneros); Adolphe Coster, *Baltasar Gracián* (exhaustive biographico-critical study published in the *Revue Hispanique*, vol. xxix, 1913, but published as a book in 1914); Carmelo de Echegaray, *Trueba* (discourse concerning the Biscayan poet); Eguía Ruiz, *Literatura y literatos: estudios contemporáneos*; F. Flores García, *El teatro por dentro*; J. Gómez Centurión, *Jovelanos y los colegios de las Ordenes militares en la Universidad de Salamanca*; N. González Auriolas, *Cervantes en Córdoba* (awarded a prize in the Córdoba Juegos Florales); Julián Juderías, *La leyenda negra y la verdad histórica* (historical study that won the prize in a public contest, and examines the opinion that Europe holds concerning Spain); Manuel Machado, *La guerra literaria (1898-1914)*; J. Ortega y Gasset, *Meditaciones del Quijote*; Rodríguez Marín, *Cervantes y la ciudad de Córdoba. Nuevos documentos cervantinos* (this latter containing 122 new documents), and *Lope de Vega y Camila Lucinda*; R. Ruiz Amado, *Don Miguel Mir y su "Historia interna documentada de la Compañía de Jesús"*; Lucas de Torre y Franco-Romero, *Mosén Diego de Valera*; and Menéndez y Pelayo, fourth volume of the *Obras completas*. There was also a fair output of scholarly reproductions (both critical editions and those intended for

scientific popularization): *Cancionero de Romances impreso en Amberes sin año* (by Menéndez Pidal); *Leyenda del Canallero del Cíeme* (by Emeterio Mazorriaga); an edition of the long lost MS. of Dr. Francisco Cervantes de Salazar, entitled *Crónica de Nueva España*, which is of capital importance for a knowledge of the conquest of Mexico (by M. Magallón, under the auspices of The Hispanic Society of America); and Cervantes, *Obras completas anotadas: La Galatea*, vols. i and ii (by R. Schevill and Bonilla y San Martín). *Clásicos Castellanos* continued their production of scholarly editions for the general public: *Lazarillo de Tormes* (by Cejador); Fernando de Herrera, *Poesías* (by V. García de Diego); Cervantes, *Novelas ejemplares*, vol. i (by Rodríguez Marín); Luis de León, *De los nombres de Cristo*, vol. i (by Federico de Oms). The *Biblioteca Renacimiento* (the Spanish "Everyman's") has also reproduced some interesting works: Lorenzo Gracián, *El Criticón* (by Cejador); Tirso de Molina, *Cigarrales de Toledo* (by Said Armesto); and Lope de Vega, *La Dorotea* (by Américo Castro). Cristóbal Suárez de Figueroa's *El Pasajero* was published by the *Sociedad de Bibliófilos Españoles*, with an introduction by R. Selden Rose.

PROSE has been interesting chiefly for the new writers that have attracted attention, or for writers, familiar in other fields, who now appear with fiction or essays: Blanco-Belmonte, *Pompas de jabón* (realistic stories); A. Larrubiera, *Margara* (novel of Santanderino customs); J. Francés, *La danza del corazón* (hailed as his best work); J. Pallarés, *Nihil novum* (short stories that promise well); Blanca de los Ríos de Lampérez, *El tesoro de sorbas* (short stories, forming vol. vi of her *Obras completas*); E. Marquina, *Juglarías* (short compositions written to be read at certain public functions, whence the title); Concha Espina de Serna, *La esfinge maragata* (novel of customs of the Leonese district of Maragatería); P. de Répide, *Costumbres y devociones madrileñas* (describing all the popular festivals and customs of the year in Madrid); and F. Martín Caballero, *Vidas ajenas* (short, biographical accounts of six important characters).

POETRY during the year was in almost the same condition as prose. G. Morenas de Tejada, a young journalist favorably known as a prose writer, appeared with a volume of verse, *Las fuentes amargas*, hailed as an auspicious promise for the future. José Rodao, a fond father reveling in family scenes, published a delightful volume, *Mischiquillos y yo*. Emilio Muñoz García's *Por la región azul* (poems filled with gentle and sincere melancholy) was well received; and Enrique Vázquez de Aldana increased his literary baggage by a volume entitled *Cintas de la cabalgata azul*. Despite his blindness, the well-known poet, Cándido Rodríguez Pinilla, produced *El poema de la tierra*, with a prologue by Miguel de Unamuno, rector of the University of Salamanca. Vicente Orti Belmonte, with his *Solo Allah es vencedor* won the prize in the *Juegos Florales* at Córdoba. Other Floral Games were held at Sevilla.

DRAMA fared somewhat better this year than other literary forms, as it also did last year. Francisco Villaspesa wrote a poetic drama, *Doña María de Padilla*, produced successfully by María Guerrero and her husband, Fernando

Díaz de Mendoza. José de Elola, novelist, storyteller, scientist, and sociologist, published the first volume of his *Obras dramáticas*, which had been well received when staged. Pérez Galdós produced his *Alceste* in April. The Alvarez Quintero brothers (Serafin and Joaquín) presented *La consulesa* (written especially for that gifted actress, Joaquina del Pino, and performed by her at her benefit); and obtained a new triumph with *Los leales*. By Francisco Acebal we have a pleasing comedy, *A la moderna*; and to Alberto Insúa and Alfonso Hernández Catá we are indebted for the bright comedy, *En familia*. From G. Martínez Sierra we have *La mujer del héroe* (ainéte), *La tirana* (musical comedy), *Los pastores* (comedy), *Juventud: divino tesoro* (comedy); and a lyric drama (music by J. M. Usandizaga), *Las golondrinas*, which was cordially received. Eduardo Marquina obtained a real triumph at the Teatro Español with his tragedy, *La hiedra*.

SPITZKA, EDWARD CHARLES. An American neurologist, died Jan. 13, 1914. He was born in New York City in 1852, and was educated at the College of the City of New York, and at the University Medical College (New York University), from which he received the degree of M.D. in 1873. For the three years following he studied medicine at Leipzig and Vienna. He served for a time as assistant in the laboratory of embryology and histology at the University of Vienna. On his return to New York he engaged in the practice of medicine, specializing in the treatment of internal diseases, particularly of the nervous system. From 1885-87 he was professor of medical jurisprudence, and the anatomy and physiology of the nervous system in the New York Post-Graduate Medical College, and for many years he was also consulting neurologist of the Sydenham Hospital. Throughout his professional life he was an untiring investigator and his researches were of great importance; probably his most important discovery was that of interoptic lobes in the reptilian brain, although he also brought to light numerous facts in the anatomy of the human brain, and was called as an insanity expert in many noted cases, including the trial of Guiteau for the murder of President Garfield. At various times he was secretary of the Society of American Jurisprudence of Medicine, editor of the *American Journal of Neurology*, vice-president of the neurology section of the ninth International Medical Congress, and was president or an officer of many other medical and scientific societies. He was the author of a *Treatise on Insanity* in 1883, and also wrote the sections on diseases of the spinal cord and on inflammation, anæmia, and hyperæmia of the brain in William Pepper's *System of Medicine*, published in 1887.

SPLENETIC FEVER. See VETERINARY MEDICINE.

SPOROTRICHOSIS. Sporotrichosis is due to a yeast fungus, the sporothrix. When this

organism obtains entrance to the human body it causes chronic subcutaneous abscesses which spread in a more or less direct line up and down the limbs, along the lymph channels. One case was reported in which the eyelids were affected. The organism gains entrance generally through a wound on the arm or forearm. According to Sutton of Kansas City the disease was quite common in the Mississippi River basin. Out of 58 cases recently recorded, 54 were infected while living in the region; out of 10 later cases, 9 were infected in this territory. Sutton was of the opinion that many cases go unrecognized, and that a considerable number were not reported. The only treatment which seems to influence the disease consists in large doses of potassium iodide taken internally. Locally, ordinary antiseptics are effective.

SPRINGS, MINERAL. See HYDROTHERAPY; SARATOGA SPRINGS.

STAR SPANGLED BANNER CENTENNIAL. See CELEBRATIONS.

STATE BANKS. Under this head is sometimes included loan and trust companies, savings banks, and those commercial banks chartered by State governments. The statistics here given, however, apply only to the latter. For other items, see LOAN AND TRUST COMPANIES; SAVINGS BANKS; BANKS AND BANKING; and FINANCIAL REVIEW. The report of the Comptroller of the Currency showed that on June 30, 1914, there were 14,512 commercial banks in the United States with capital of \$501,154,000, and total resources of \$4,353,663,000. Their number had increased during the fiscal year by 501, and their resources by \$210,610,000. Their aggregate loans were \$2,879,801,000. Nearly 30 per cent of these loans were time loans secured by one or more name paper without collateral; nearly 20 per cent were secured by real estate; 11 per cent by stocks and bonds; and 11 per cent by other collateral; while over one-fourth were unclassified. These banks held a total of \$388,250,000 of stocks and bonds. Their individual deposits aggregated \$3,226,793,000, of which 58 per cent were subject to check, and 21 per cent were savings deposits.

STATISTICAL ASSOCIATION, AMERICAN. The seventy-sixth annual meeting of the American Statistical Association was held at Princeton, N. J., Dec. 28-31. At the same time were held sessions of the American Economic Association (see POLITICAL ECONOMY) and the American Sociological Society (q.v.). Topics treated in the sessions of the association include "The Relations of the Association to (a) Federal Statistical Bureaus, and (b) State Statistical Bureaus," with papers by Frederick L. Hoffman, Robert E. Chaddock, and Leonard W. Hatch. The relation of the association to municipal statistical bureaus was treated by Edward M. Hartwell, and its relation to public service and public statistics was treated by Frederick A. Cleveland, M. O. Lorenz, and Julius Parmelee. Prof. John Gillin presented a paper on social statistics and surveys. A round table session was had in conjunction with the American Economic Association on "The Statistical Work of the United States Government." A number of distinguished economists and statisticians took part. A final session was devoted to "Improvement and Extension of the Registration Service," with papers by William J. Harris, Cressy L. Wilbur, and Louis I. Dublin.

See **POLITICAL ECONOMY**, *American Economic Association*.

STATISTICS. See **VITAL STATISTICS** and paragraphs under the direct title.

STEAM ENGINES. An interesting combination of gas engine and reciprocating engine was to be found during the year at the new Detroit shops of the Ford Motor Company, where a two-cylinder gas engine, arranged in tandem, and a tandem compound condensing engine were both connected to the steam shaft, and were capable of developing 6000 horsepower. This plant was designed to secure the greatest economy, as the gas engine works most advantageously when under full load, and it was not purposed to operate one of these units, of which there are four, unless there was at least half a load for it. The steam portion of the unit was to handle the extra load and do the regulating, as it was provided with a governor, which was not the case with the gas side of the unit. The steam exhaust is connected with a surface condenser in which the vacuum is regulated according to the atmospheric temperature, and the warm circulating water, after having passed through the condenser, is passed through the heating system in the adjoining buildings. On the other hand, the exhaust from the gas engine goes to a superheater, located between the high and low pressure steam cylinders, and regenerates the steam before it reaches the low pressure cylinder. Instead of using direct steam from the boiler, as is usual, another portion of the hot gas of the engine exhaust passes through the jacket of the high pressure steam cylinder and prevents the heat loss. All the exhaust gases then pass to a feed water heater, through which all the water required for steaming passes. This feed water is first circulated through the jackets of the gas engine cylinders, where it is heated to a temperature of from 150° to 180°, and then in passing through the heater is raised to 250°. The plan is that nearly all of the heat generated is utilized, and great savings and economy are anticipated. The gas engine side of the unit is of the 4-stroke system, with a cylinder 42 inches in diameter, and 72 inches stroke, while the steam cylinders are 36 and 68 inches in diameter, and 72 inches stroke.

The use and development of such forms of steam engines as the unaflow or locomobile types continued during the year, while there was but little occasion for any improvement in the standardized form of reciprocating engines. The unaflow engine in 1914 had been taken up by several leading engine manufacturers, and a type had been secured with a steam consumption of from 11 pounds to 12 pounds per horsepower-hour for high pressure. It seemed to be shown that a cylinder working on the unaflow principle would show almost as much maximum speed as a combined or multistage engine, and a new form was being given serious consideration by engineers designing power plants, where small units with high pressure were required.

During the year the first unaflow engine built in America, under the direction of Professor Stumpf, was to be put in operation. It was a 15 by 16-inch engine, designed to carry 100 kilowatts, and running at 250 revolutions per minute, with a steam pressure of 145 pounds, a superheat of 88°, and a vacuum of 25½ inches. Under these conditions, it developed 1 horsepower on 12.5 pounds of steam. Other designs

of unaflow engines were brought out by the Skinner Engine Company, while the Nordberg Company produced a unaflow engine with poppet valves designed to supersede for high pressures and superheats, its previous design employing a Corliss valve. One of the interesting features of the year was the placing in commercial service of a Buckeye-mobile, a unit rated at 115 horsepower, and used in connection with a 75-kilowatt alternator.

The combination of reciprocating engines with turbines continued to find application, especially in the case of plants where efficient reciprocating engines were already in use, or where the economical characteristics and use of the reciprocating engine required consideration. Such mixed installations were distinctly serviceable in many cases, and a recent plant in Milwaukee was designed with a total equipment rating of 61,900 kilowatts.

STEAMSHIPS. See **SHIPBUILDING**.

STEAM TURBINES. During the year progress was made both in the details of construction, and in the size of the various turbo-generators used by the important electric lighting stations. The 30,000-kilowatt unit had become recognized practice, while designers were considering the construction of a 50,000-kilowatt unit. The performance of large turbo-generators at the central power stations was considered in an interesting report made to the American Institute of Electrical Engineers in June, 1914, in which attention was called to the fact that the thermal efficiency was the only just criterion to consider in discussing the economy of a large central station plant, and a comparison was made of the performance of various units of different sizes. The report indicated that there was a very wide range of capacity over which the water rate changed but slightly, and that the rate of 14 pounds per kilowatt hour was passed at an output rating of about 5000 kilowatts, while the rate of 13 pounds was reached only at an output of 30,000 kilowatts.

An interesting development of the year in the case of the largest size turbine units was a combination of two or more elements with motors of different speeds, for example, a high pressure single flow element operating at 1500 revolutions per minute in combination with a double flow low pressure element at 750 revolutions per minute. This arrangement was devised to take advantage of the best rotative speed for each element, and the gain more than counterbalanced the special division of the generator. The turbine continued to show for large sized units greater efficiency than the reciprocating engine, but in small sizes its use was inferior to the economical forms of the latter, and where it was installed its use was governed by considerations not of efficiency, but of first cost. As regards rated output, the turbo-generator unit was showing a distinct tendency towards lower cost, and that way could more than hold its own with internal combustion engines where the original cost was necessarily high.

The largest steam turbine in the world was a 35,000-kilowatt unit for the Philadelphia Electric Company. This was a 13-stage horizontal Curtis turbine, 63 feet, 2 inches long over all, 21 feet, 7 inches wide, and 15 feet, 10 inches high. Its weight was 600 tons, and it received steam at 215 pounds pressure, and 150° superheat, exhausting against an absolute pressure

of 1.5 inches of mercury. When operating at the most economical load, 25,000 kilowatts, it was expected to develop a kilowatt hour on 11.9 pounds of steam, but when used at the full rated load of 35,000 kilowatts, the water rate would increase to 12.6 pounds per unit, though, with a better vacuum, steam consumption would be slightly lowered. The condenser for this turbine naturally was the largest ever constructed, and was of the centre flow service type, containing 50,000 square feet of surface in 1-inch tubes. The injection water is supplied with a 48-inch pipe. The various auxiliaries are all turbine-driven centrifugal units, and the air pumps are of the Le Blanc type. The generator delivers 3-phase, 60-cycle current at 13,200 volts, at a speed of 1200 revolutions per minute.

Another notable turbine was the 25,000-kilowatt Parsons turbine at the Fisk Street station in Chicago, a unit of English construction, which was placed in satisfactory operation during the year. This unit was of the 2-cylinder tandem type, and shows about the same economy as the Curtis turbine at Philadelphia.

STEEL. See **IRON AND STEEL**, and **METALLURGY**.

STEELE, DANIEL. An American clergyman, educator, and author, died Sept. 2, 1914. He was born in Windham, N. Y., in 1824, graduated from Wesleyan University in 1848, and for the two years following was tutor in that institution. In 1850 he was ordained a minister of the Methodist Episcopal Church, and acted as pastor in several cities in Massachusetts until 1861. From 1862 to 1871 he was a professor in Genesee College, N. Y. He was elected first president of Syracuse University in 1872, but resigned in the same year to become a pastor in Boston. He filled successive pastorates in Auburndale, Lynn, Salem, Peabody, Reading, and Boston until 1888. In 1884 and in 1891 he was professor of New Testament Greek at Boston University; from 1886 to 1889 was professor of systematic theology, and filled the chair of practical theology in 1892. He was the author of: *Commentary on Joshua* (1873); *Love Enthroned* (1875); *Commentary on Leviticus and Numbers* (1891); *Christian Perfection* (1896); *Half Hours with St. John's Epistles* (1901); *Steele's Answers* (1912), and contributed also to religious periodicals.

STEFANSSON, VILHJALMB. See **POLAR RESEARCH, Arctic**.

STERRETT, JOHN ROBERT SITTLINGTON. An American scholar and educator, died June 16, 1914. He was born at Rockbridge Baths, Va., in 1851, and was educated at the Universities of Virginia, Leipzig, Berlin, Athens, and Munich, receiving the degree of Ph.D. from the last university in 1880. He served as a professor of Greek in Miami University in 1886 and from 1888 to 1892 held the chair of Greek at the University of Texas. From 1892 to 1901 he was professor of Greek at Amherst College, and from 1901 until his death was head of the department of Greek at Cornell University. He was the leader of various archaeological expeditions to Asia Minor, and in 1896-97 was professor at the American School of Classical Studies at Athens. He was a member of several scientific societies, associate editor of the *American Journal of Archaeology*; was joint editor of the *Cornell Classical Studies*; was editor and translator of Strabo for the Loeb Classical Library; and con-

tributed to magazines on subjects of travel and archæology. His published writings include: *Inscriptions of Sebaste*; *Inscriptions of Assos* (1885); *Inscriptions of Tralles* (1885); *Wolfe Expedition to Asia Minor* (1888); *The Torch-Race* (1902); *The Iliad of Homer* (1907). He was the organizer of the Cornell Expedition to Asia Minor in 1911.

STEVENS, LILLIAN M. N. An American temperance advocate, died April 6, 1914. She was born in Dover, Me., in 1844, and was educated at the Foxcroft Academy. In early womanhood she taught school and in 1867 married Michael Stevens, a merchant of Portland, Me. In 1874 she assisted in organizing the Maine Woman's Christian Temperance Union, was its treasurer from 1874 to 1877, and in the latter year she became president. From 1894 to 1898 she was vice-president of the National Woman's Christian Temperance Union; after the death of Frances E. Willard in 1898, she became acting president, and in the same year was elected president, being reelected at each succeeding year up to 1914. She was also vice-president at large of the World's W. C. T. U. and for many years was a representative from Maine in the National Conference of Charities and Corrections.

STEVENSON, ADLAI EWING. Former Vice-President of the United States, died June 14, 1914. He was born in Christian Co., Ky., in 1835, the son of a Scotch farmer. He received his education in the common schools and at Centre College, Ky. In the last year of his college course he was called home on account of an accident to his father and was never able to return. He took up the study of law, was admitted to the bar in 1857, and began practice at Matamora, Ill. From this time he took an interest in politics, and in 1865 was elected district attorney, which post he held for four years, and for the following four years was master in chancery. Removing to Danville, Ill., he formed a partnership with J. S. Ewing, and in 1874 was nominated for Congress by the Democrats of the Bloomington district, which was normally Republican. He won by a majority of 1200 votes, but was defeated for reelection, although again elected in 1878. He was a delegate to the National Democratic Convention of 1884 in Chicago, and after the election of President Cleveland was appointed First Assistant Postmaster-General, during which appointment he removed 45,000 Republican postmasters and replaced them with Democrats. In 1892, during the efforts to bring about the recognition of President Cleveland, Stevenson's loyalty to the former and his effectiveness as an organizer led to his nomination as Vice-President, and he was elected. He was a nominee for the Vice-Presidency on the ticket with William J. Bryan in 1900 and in 1908 was a candidate for Governor of Illinois, but was defeated by Governor Dineen after a contest in the Legislature, after which time he took no active part in politics. He was the author of a book of political reminiscences. Mr. Stevenson was very popular with the Republicans as well as Democrats and it was said that he did not have a single bitter enemy.

STEVENSON, FANNIE (VAN DE GRIFT) OSBOURNE (MRS. ROBERT LOUIS STEVENSON). An American writer and artist, but best known as the wife of Robert Louis Stevenson, died Feb. 19, 1914. She was born in Indianapolis in 1840,

and in 1857 was married to Samuel Osbourne. Shortly after her marriage she removed with her husband to California, and in a few years they separated by mutual consent. Mrs. Osbourne returned to Indianapolis in 1875 and soon afterwards removed to Paris where she studied painting for three years and achieved some repute as an artist. After the death of her youngest child she became reconciled with her husband and both returned to Indiana. Not long afterwards they separated again and she for the second time took up her residence in California.

While a student in Paris she had met Robert Louis Stevenson, and both were members of an artists' colony at Gutz. After her return to California Mrs. Osbourne suddenly became seriously ill, and Mr. Stevenson, hearing of this, at once set out for California. He traveled by steamer on the ocean and by emigrant train across the States; his experiences on this journey are detailed in *Across the Plains*. In December, 1878, reaching San Francisco worn out, he himself experienced a long and severe illness, and Mrs. Osbourne, who by this time had recovered, nursed him back to health. She obtained a divorce from her husband in the following spring and was at once married to Stevenson. For a time after their marriage they lived in a mountain town in the Sierras in the hope that the high altitude would benefit Stevenson's health, and while here Stevenson wrote *The Silverado Squatters*. He grew no better and they returned to Europe, spending much time in the south of France.

In 1887 they returned again to the United States. Mrs. Stevenson finally accompanied her husband to the South Seas where, after touring among the islands they finally settled at Samoa, where Stevenson died on Dec. 4, 1894. Throughout their life together Mrs. Stevenson cared for her husband as a nurse, acted as his secretary, and in every possible way conserved his declining strength. After his death she returned to San Francisco and built a house where she lived with her son Lloyd Osbourne and his family. This house, which was filled with Stevenson's books and objects of art, and with Samoan relics, was saved from destruction in the fire of 1906 by members of the Bohemian Club. In 1908 Mrs. Stevenson sold this house and removed to her country home at Montecito. She died at Santa Barbara. She was a frequent contributor to magazines and periodicals, and published *Cruise of the Janet Nichol Among the South Sea Islands: a Diary* (1914).

STOCK EXCHANGE. See FINANCIAL REVIEW.

STOCK RAISING. LIVE STOCK SUPPLY. The receipts of live stock at the six principal western markets of the United States in 1914 were, in round numbers, 6,500,000 cattle, 15,000,000 hogs, and 12,000,000 sheep, showing a decrease of nearly 775,000 cattle, 2,000,000 hogs, and 6,000,000 sheep, as compared with 1913. The principal cattle shortage was at Kansas City, where it amounted to about 300,000 head, and there was no increase at any of the markets. More than one-half of the decrease in hog receipts was at Chicago. Hog cholera was the chief cause of this enormous decrease. During the first six months there was a heavy movement of sheep to market, showing a big increase, but the decline during the last six months made a

decrease of nearly 600,000 head for the year, most of the loss being at Chicago.

During the fiscal year the losses due to exposure and disease were as follows: Cattle, 1,737,400, or 19.8 per 1000 head; sheep, 2,124,400, or 21.7 per 1000; swine, 7,004,800, or 119 per 1000; horses, 522,800, or 20.6 per 1000. The loss of swine was greater than in the previous year, and was mainly caused by hog cholera.

The prices for live stock were very unsteady, especially during the last six months, the cattle market being very erratic, due in part to the general changes going on in the live stock industry, but also in part to the European War, and to the outbreak of the foot-and-mouth disease, which occurred in October.

The quarantine of the Stock Yards at Chicago and Saint Louis, while they were being disinfected, interfered with the sale of stocker cattle. On the other hand, the slaughter trade was not interfered with, as all the quarantine markets were on a slaughter basis, though quotations were unsteady. It caused an unusually heavy stocker trade at Kansas City, and a fire there created a great difficulty in handling the oversupply of cattle. The International Live Stock Show at Chicago, and the Royal Show at Kansas City were not held, in order to avoid the possible danger of further spreading the disease. Domestic meat consumption was somewhat curtailed on account of the disease.

Each year since the census of 1910 there has been a constant reduction in the number of meat animals in this country, yet the value per head has advanced so, that notwithstanding the number has been reduced by about 18 million head, the total value of the meat-producing animals is considerably higher than in the census year. Although this shortage has been felt for several years in the United States, it was not until 1914 that the depletion of herds and flocks throughout the world was noticed.

When the Underwood tariff went into effect, late in 1913, the lowering of values was temporary and insignificant, because of this general world shortage. South America and Australia are having difficulty in supplying England with meat that was formerly sent from the United States. The European War is still further decreasing the supply of all kinds of domestic animals in all the countries of Europe. According to estimates of the Department of Agriculture, the present beef production in the United States is somewhat less than 7,000,000,000 pounds annually.

About one-third of the cattle of the country other than milch cows are in seven of the corn-belt States, where there is comparatively little grazing. Many of these cattle are bred on the cheaper grazing lands, and shipped as stockers and feeders to the corn belt, where they are fattened, finished, and marketed by men who are feeders and not breeders nor general farmers. But this practice, which has grown up during the last 50 years, seems destined to be changed to some extent. Already under an intensified agriculture there is a tendency to raise more cattle in the corn-belt States, and to do more finishing nearer the grazing lands. Nevertheless, the cost of producing beef and other meats seems to be increasing, and under any system the present prices are likely to be maintained or be even higher in the future, unless there is some source of supply from foreign countries

not now available. The number of calves slaughtered has gradually been decreasing now for three years, which is an indication that either fewer calves are born, or that more are raised to maturity.

Since 1905 there has been an increase of 59 per cent in the number of animals kept on National forests as a result of supplying watering places, and the new system of granting grazing permits. These lands now furnish grazing for about 1,600,000 cattle and horses, and 7,600,000 sheep and goats, in addition to the young animals, and temporary grazing to many animals which feed through the forests under crossing permits. The grazing fees are now returning over \$1,000,000 annually to the National government.

The Secretary of Agriculture points out that there is an opportunity to improve the output of live stock products in the South, for 12 Southern States import more than \$48,000,000 worth of meats and dairy products and poultry. To assist in remedying this condition, Congress appropriated \$50,000 for the purchase of a farm in Louisiana, and for the investigation of live stock production in the area where the cattle tick has been eradicated, and in the boll weevil and cane sugar districts. Unusual efforts have been made during the year by State and Federal officials to prevent the enormous losses caused by disease and exposure. The growing of more of the smaller meat animals has also been strongly urged in order to help solve the growing scarcity of meat.

MEAT AND MEAT INSPECTION. The system of distributing meat has been a very wasteful one, and this has led the Department of Agriculture to undertake investigations in which shipments of animals whose approximate cost of production is known, have been followed from the farm through the stock yards and packing plants, to wholesaler, retailer, and consumer. All normal factors have been taken into account, and although sufficient data have not been obtained to be publicly announced, it is believed that the results will show the changes necessary for reducing the unavoidable wastes which now occur during distribution. Already it is apparent that the parcel post will be one important factor in solving the problem, and private individuals have found that farm-slaughtered meat can be economically marketed in this way. The municipal slaughtering plant erected at Paris, Texas, in 1909, has proved to be so economical that this coöperative method of slaughtering farm animals has been followed in several other places.

Meat inspection was conducted by the Federal government at 893 establishments in 244 cities and towns. The total number of animals undergoing antemortem examination was 57,033,401, of which 174,373 were suspected. Of the number passed, 281,303 were condemned. There were also large quantities of meat products condemned on reinspection. The imported meats inspected amounted to 197,389,348 pounds, of which 0.28 per cent were condemned. There were also 31,839 samples of meat, and meat food products analyzed in the government laboratories. The use of preservatives seems to be growing less common.

The number of cattle and calves slaughtered, under government inspection during the fiscal year ended June 30, shows a decrease of more

than 700,000 from the preceding year, and a decrease of 3.5 per cent, as compared with the average of the previous seven years, the period during which the present law has been in force. In the number of swine there was an increase over 1913 of more than a million, and an increase of 2.6 per cent over the average of the previous seven years.

Revised regulations in regard to slaughtering animals were signed by the Secretary of Agriculture, July 15, to become effective November 1, except those governing imported meats, which go into effect Jan. 1, 1915.

The new regulations provide for antemortem examinations, and also the withdrawal of inspection from establishments that violate the regulations. Packers are also permitted to sell second-class sterilized meat on a plan similar to that allowed by the German and Austrian governments. New regulations were issued by the United States government allowing cattle to be shipped from the quarantined districts of Mexico directly to slaughtering centres in this country without the 60-day detention on the border, as formerly. This applies only to cattle that are to be slaughtered; all others must as formerly be quarantined for 60 days in Texas as a precautionary measure against the spread of the cattle tick. There were also new regulations governing the interstate movement of live stock, which became effective July 1. They were designed to facilitate the movement of live stock from quarantined areas, or from public stock yards.

THE INTERNATIONAL TRADE IN MEAT AND LIVE STOCK. For the fiscal year ended June 30, 1914, the United States exported 143,357,441 pounds of meat and meat products, most of which consisted of lard and other pork products. The amount imported was 49,892,878 pounds, of which beef constituted 43,837,348 pounds. This beef came from Mexico, Canada, Argentina, Uruguay, Australia, and New Zealand, 58 per cent coming from Argentina. About 67 per cent of the Argentine export is controlled by Chicago packing companies, which ship it to themselves in New York. Meat from Australia affected the packing interests on the Pacific coast.

The outbreak of the war unsettled the live stock market. At first there was a sharp advance in domestic prices, but this was soon followed by liquidation because of the high cost of feed, the tight money market, and the inducement to sell at the high prices. Consequently the fall prices on many grades of live animals were lower than if the war had not occurred. In particular the elimination of Germany as a buyer of hog products seriously depressed the prices for live hogs and dressed pork.

Nearly all the 9,000,000 pounds of chilled and frozen beef which had been coming to the United States from Argentina went to Europe. On September 9, the government of France placed all fresh meat on the free list, and since then an unusually large quantity of fresh and canned beef, along with other foodstuffs, has been exported from this country, not only to France, but to other European countries. Coincident with this the importation of meat was materially below that of the closing months of 1913.

There were substantial increases in the number of cattle, sheep, and pigs in England and Wales. In Argentina, Australia, Cuba, Mexico, and Russia, the number of cattle has remained

CORRIEDALE EWE

CORRIEDALE SHEEP, YEARLINGS

STOCK RAISING

NEW SHEEP IMPORTED INTO THE UNITED STATES FROM NEW ZEALAND

Page 11

in a stationary condition or with a diminishing tendency. In Canada, New Zealand, and Uruguay, there has been some increase, but we can expect no material increased supply of meat at present unless breeding stock is slaughtered; this will probably not occur in these countries, though doubtless it will be true of continental Europe for a considerable area around the battlefields.

The war practically stopped the importation of purebred draft horses into the United States, with the exception of a very limited number from England. For several years previously the imports averaged about 3000 annually, but this loss will not be felt, as there is a large number of purebred stock from which to breed draft horses as needed. The principal breeds are now well established in this country, and a good opportunity is offered for American breeders, as the war seems destined to use up all animals available for service. The United States, next to Russia, has more horses than any other country; 58 per cent of the world's supply is in these two countries. European agents began to scour the United States for army horses soon after the outbreak of the war. In England, thousands of farm horses were commandeered for the use of the army.

WOOL. At the call of the Secretary of Agriculture there was a conference in Washington, in June, of wool interests, at which producers, dealers, and manufacturers were present to discuss matters of mutual interest, in particular to discuss measures for increasing the output of wool in the United States, such as the destruction of predatory animals, standards for grading wool, and experimental farms for sheep breeding.

The grading of wool has not yet become an art in America, as it has in Australia. The Bureau of Animal Industry has prepared a collection of American and Australian wools to use in educating farmers to prepare their wool so that income from wool may be increased, even with the present output. The growers' semico-operative selling agency, which has been in operation six years, has accomplished much less than anticipated, as it was used as a lever to obtain higher prices rather than to consign their wool to the company. The liquidation of mutton sheep, which has been in progress for several years, has ceased so that the price of mutton is now nearly comparable with that of beef. As a result, Virginia, Kentucky, Tennessee, and some of the trans-Missouri States have begun stocking up with sheep.

The number of sheep shorn in Australia was 109,692,264 head. The average weight of the fleece was 7.87 pounds, as compared with 7 pounds for 1913. The total clip was larger than the previous record clip of 1912. The quality was good, being well grown, and with a much broader fibre than the previous record clip of 1913. The Corriedale sheep, of New Zealand, which is the result of years of selecting crosses of Lincolns and Merinos, is growing in popularity as a general-purpose sheep. They are hornless, and have a heavy carcass covered with a good fleece. Arrangements have been made to bring some to the United States.

For the first eight months the imports of raw wool showed a big increase over the previous years as a result of the new tariff. In early summer coarse wools were sold for very low

prices, although in spite of increased imports the market for fine wool continued good. The European War reversed the market conditions; there was a demand for blankets, and the price of crossbred wool advanced. On October 6, England declared an embargo on wool and woollen blankets, which still further affected prices in the United States. This served American interests which had a supply of wool as well as though a high tariff bill had been enacted.

Bibliography. Among important publications which have appeared during the year are the following: G. E. Day, *Productive Swine Husbandry* (Philadelphia and London, 1913); C. W. Gay, *The Principles and Practice of Live Stock Judging* (New York, 1914); T. F. Hunt and C. W. Burkett, *Farm Animals* (New York, 1914); H. R. Lewis, *Productive Poultry Husbandry* (Philadelphia and London, 1913); W. M. McKee, *South African Sheep and Wool* (Cape Town, 1914); A. D. Melvin, "The South American Meat Industry," in *Year Book*, Dept. Agr., pp. 347-364 (Washington, D. C.); A. H. Sanders, *The Story of the Herefords* (Chicago, 1914); Henry P. Smith, *The Sheep and Wool Industry of Australasia* (London and Melbourne, 1914); G. F. Warren, C. H. Eckles, J. M. Evvard, and W. A. Cochel, *Farm Animals* (New York, 1914).

STONE INDUSTRY. The total value of the stone produced in the United States in 1913 surpassed all previous years, and amounted to \$83,732,995, compared with \$78,193,220 in 1912. Of the total value produced in 1913, the granite was valued at \$20,793,800; trap rock, \$9,289,809; sandstone, \$7,033,067; marble, \$7,870,800; and limestone, \$38,745,429. Pennsylvania ranks first in the value of its stone industry, and has held this position except in 1908, when Vermont reported the largest production. Other States in the order of the value of their product are Vermont, New York, Ohio, Indiana, Illinois, California, Massachusetts, and Missouri. For further details of the production of stone in these and other States, see the paragraphs on *Mineral Production* under the State articles.

STORAGE BATTERY. See **ELECTRIC BATTERIES.**

STORER, FRANCIS HUMPHREYS. An American chemist and educator, died July 31, 1914. He was born in Boston in 1832, and studied at the Lawrence Scientific School and at Harvard University in 1850-51, for two years following being assistant to Professor Cook in chemistry. In 1853 he became chemist to the United States North Pacific Exploring Expedition. Returning to Harvard for additional studies he received the degree of S.B. in 1855, and for the two years following studied abroad. From 1857 to 1865 he practiced as chemist in Boston, and from 1865 to 1870 he was professor of general and industrial chemistry at the Massachusetts Institute of Technology. From 1870 to 1907 he was professor of agricultural chemistry at the Bussey Institution, and from 1871 to 1907 was dean at that institution. He was the author of: *Manual of Inorganic Chemistry* (1869); *Manual of Qualitative Chemical Analysis* (1868); *Elementary Manual of Chemistry* (1894); *Manual of Qualitative Analysis* (1899); *Bulletin of the Bussey Institution*, etc.

STORM WARNINGS. See **WIRELESS TELEGRAPHY AND TELEPHONY.**

STRAITS SETTLEMENTS. A British crown colony chiefly in the Malay Peninsula,

deriving its name from the Straits of Malacca. The colony is composed as follows, area in square miles, population 1911, government seats in last column:

	Sq. m.	Pop.	Cap.
Singapore	217	311,985	Singapore
Penang	571	278,008	George Town
Malacca	720	124,081	Malacca
Total	1508	714,069	Singapore

Included with Singapore are its dependencies—the Cocos or Keeling Islands, about 20 in number, with a population of about 700; Christmas Island, about 62 square miles, population about 1100. Included with Penang are Province Wellesley, a strip of territory averaging 8 miles in width, and extending 45 miles along the coast, with 10 miles of territory to the south of the Krian, a total area of 280 square miles; and the Dindings, about 183 square miles. The total population was estimated for 1913 at 745,362 (including the population of Labuan). Of these, 488,236 were males, and 257,126 females. In Singapore (including the dependencies) there were 226,863 male and 92,056 female Asiatics, 4406 male and 1732 female whites, and 2405 male and 2580 female Eurasians; in Penang (including dependencies), 173,996 male and 107,462 female Asiatics, 810 and 482 whites, and 845 and 970 Eurasians; Malacca, 77,899 and 50,865 Asiatics, 233 and 86 whites, and 779 and 893 Eurasians. Education (not generally compulsory) is provided in government and grant-in-aid schools to the number of 225, with an enrollment of 25,673, and an average attendance of 23,253.

No tonnage dues for general purposes are levied, and the ports are free. The trade is largely transit, though tapioca, rice, and rubber are produced for export in Malacca and Province Wellesley, and sugar in Province Wellesley. In the table below are shown in Straits Settlements dollars trade and finance statistics for three years, and shipping in tons entered and cleared:

	1910	1911	1912
Imports	364,470,653	398,084,421	450,089,016
Exports	324,189,786	341,889,822	375,128,758
Revenue	9,336,328	11,409,221	12,912,577
Expenditure ..	7,532,242	9,085,889	9,295,102
Shipping	23,429,495	24,086,904	25,841,494

The railways of the Straits Settlements came under the management of the Federated Malay States government Jan. 1, 1912. The terms called for a lease of 21 years, subject to septennial revision. It was later proposed to sell the railways outright to the Federated Malay States government. The Governor in 1914 was Sir Arthur Henderson Young, appointed 1911.

STREET CLEANING AND SNOW REMOVAL. A snow removal conference was held at Philadelphia early in the year, an exhibit of street cleaning appliances was held under the auspices of the Street Cleaning Department of New York City in November, and street cleaning and snow removal were extensively discussed in various technical societies, and in the technical press during the year. A novel "snow fighting" plan was worked up by the Street Cleaning Department of New York City and authorized by the Board of Estimate and Apportionment for use in 1914-15. Briefly, the new plan, which

was given an experimental trial on a practical scale in 1913-14, was to begin to clear away the snow as soon as a heavy fall begins, instead of letting it accumulate, and to use the sewers instead of wagons for the removal of the snow to the water front. When a heavy snowfall begins each unit of the normal street cleaning force will become the leader of a snow-removal squad, the other members being subject to emergency call. Push shovels, or pans, will be used to collect the snow and move it along the street surface without lifting until it is dumped down the nearest manhole into the sewer. Flushing the sewers from water mains will be used where needed to supplement the normal sewage flow. An apparently attractive scheme for extra pay for extra work was devised.

STREET RAILWAYS. See MUNICIPAL OWNERSHIP.

STRIKES. While there was considerable unrest during 1914, thousands were unemployed, and earnings scanty, those involved in labor disputes were not as numerous as in recent years. (See UNEMPLOYMENT; and ARBITRATION AND CONCILIATION.) No time, in fact, during the last dozen years has the number been so small, the 175,000 of 1907 being the closest approach to the 160,000 during 1914. However, the strikes in the Colorado coal, and the Calumet copper mines were among the hardest fought conflicts in our industrial history. The rising prices and the increased cost of living perhaps still continue to be the main causes for the unrest, while the raising of wages usually results from the pressure on the part of the workingmen. According to *Bradstreet's*, the number of persons out on strike, during each of the last 10 years, were as follows: 1905, 200,000; 1906, 550,000; 1907, 175,000; 1908, 230,000; 1909, 223,000; 1910, 550,000; 1911, 255,000; 1912, 475,000; 1913, 425,000; 1914, 160,000.

CALUMET STRIKE. On April 13, 1914, the secretary of the Western Federation of Miners announced that the strikers at the copper mines of Michigan had voted to return to work, and waive recognition of the union. This famous controversy, one of the bitterest in our industrial history, began in July of the previous year in about 20 copper mines of Keweenaw Peninsula, Mich., and was called by the Western Federation of Miners. Nearly 15,000 were made idle, among whom 38 nationalities were represented; the largest group were Finns. The strikers demanded first the recognition of the Western Federation of Miners, the abolition of the "one man drill," a minimum wage of \$3 for trammers, and \$3.50 for miners, and an eight-hour day. The last two demands were granted by the operators, as were two minor grievances, namely, that the miners be granted some way of presenting their grievances, and that they be treated justly. These demands were made only after the operators had refused a request for a conference to discuss conditions. Rioting occurred in the first few days, and 2700 militia were sent to the scene by the Governor of Michigan. In addition, the companies also employed a considerable number of guards from a detective agency, called gunmen by the miners. These mercenaries were a cause of intense bad feeling; their outrages, such as shooting an Austrian miner for crossing the company's lands, created a spirit of retaliation. Several attempts at mediation on the part of Governor Ferris of

Michigan, John A. Moffat, representing Secretary of Labor Wilson, and others, were resisted by the operators and owners. The officials of the companies refused absolutely to treat with the representatives of the Western Federation, declaring that the men might return individually. In the last few days of 1913 President Moyer of the Western Federation was seized and forcibly ejected from the strike zone. A grand jury, which was instructed to look into this incident, took no action with regard to it, but proceeded to indict Moyer and 38 union officials for conspiracy to prevent nonunion men from working. In April the strikers were finally forced to submit, costing them, it is estimated, about \$1,000,000. Secretary of Labor Wilson in his annual report commented on the strike, and laid the blame upon the local operators, and expressed the conviction that the mine owners could have averted the strike. He stated: "If the managers of the property involved in this strike had dealt with the dispute at its inception as its principal owners might have done had they been on the ground, there is reason to believe that no strike would have occurred."

COLORADO STRIKE. Even fiercer and more bitter than the struggle in Michigan was that in Colorado. The latter was marked by many bloody encounters between the strikers and the hired guards of the coal mining companies, or with the so-called State "militia." The strike started on Sept. 23, 1913—some 10 years after an earlier and similar outbreak—following the vote in favor of taking such action by the convention at Trinidad the week before. It was the contention of the operators that this decision of the conference was not indicative of the attitude of the majority of the miners, since they were not really represented there. On the other hand, the strikers pointed out that it was quite necessary that they hold their meetings in secret, because of the restrictions placed upon them, and it was in this manner that the representatives to the convention were chosen. Later, in a hearing before the Federal Industrial Relations Commission, the president of one of the companies admitted that the statement on this matter published by the operators was not altogether authenticated. Conferences with the managers of the mines were asked for before and during the week following the convention in order to endeavor to avert a conflict, but the operators refused, and they did not come to Trinidad in response to an invitation of the miners to reach an agreement. Speaking of the inability to bring about a meeting between the operators and the strikers, Senator Patterson said: "I believe that if they had granted a conference, they would have reached a settlement of the strike, no matter to what extent the unions had to withdraw their claims." According to the employers, conditions in the mining camps were all that were to be desired. They asserted that liberally conducted stores, which disposed of their wares at lowered prices, the right to trade where they pleased, checkweighmen when the miners so desired, and relatively high wages went to make the lot of the workingmen so satisfactory that before the strike many made signed statements to this effect. Opposed to this, the undemocratic conditions existing in the camps, which were owned and administered entirely by the companies, and abuse of their powers by the latter and their camp mar-

shals, were among the primal causes of the discontent and extreme bitterness towards the employers.

Of the 12,000 or 13,000 workmen in the mines, the union claimed between 90 and 95 per cent were out on strike, while the operators maintained that at no time was their force reduced by more than one-half. Mr. John A. Fitch, who made an investigation of conditions in Colorado, estimated that approximately 60 to 70 per cent were out on strike. The strikers demanded first of all, the recognition of the union. This seemed to be, throughout, the vital point at issue. Second, they demanded a 10 per cent advance in wages on the tonnage rates, so as to make the remuneration about the same as that paid in Wyoming. The third demand was for an eight-hour day for all labor in and about the mines, and at the coke ovens; while the fourth asked for payment for narrow and dead work, which included timbering, brushing, and so forth. A checkweighman "at all times to be elected by the miners without any interference by company officials in said election" was the fifth; and the sixth demanded the right of the workingmen to trade wherever they pleased, and to choose their own boarding houses and doctors. Finally, they demanded "the enforcement of the Colorado mining laws, and the abolition of the notorious and criminal guard system which has prevailed in the mining camps of southern Colorado for many years."

The operators, on the other hand, replied to the first demand by stating that they would be required, should they recognize the union, to sign a contract by which they would have to collect the dues, fines, and assessments that the labor organization might levy against the workmen. Recognition, too, would have been altogether unwise, for it would become necessary for 90 per cent of the coal miners—then nonunion men—to join the organization, or else lose their jobs; and would mean the absolute closing of the "open shop" which had always existed in the State. Moreover, the operators were especially adverse to making contracts with the United Mine Workers, because of the legally irresponsible character of the latter—not being incorporated—and because they considered it a criminal organization. In proof of this latter, the operators pointed to the happenings in West Virginia, and the several indictments against the union. In answer to the second demand, it was pointed out that the wages in Colorado were already higher than in other parts of the Union, and that to increase them further would have been "little short of business suicide." An eight-hour day has already been enacted by the Colorado Legislature, but had been granted to the workers before this time.

The fourth demand, the operators contended, had no basis, for narrow and dead work had been paid for during past years, and to show that the men were well recompensed, pointed to the relatively large earnings of miners when working full time. The right of having checkweighing, it was also said, had been for many years the privilege of the workmen, and in some of the mines the laborers took advantage of this. Furthermore, the men could trade where they pleased without being prejudiced against, and could choose their own boarding house without being interfered with; but the companies usually required all their men to contribute a certain

sum each month towards the maintenance of well-organized and conducted hospital departments where the workmen and their families were given free medical attendance. And finally, it was contended that an excellent general mining law had been passed by the Colorado Legislature, and that the State authorities were well able to enforce the statutes.

The struggle became so bitter at times that there were pitched battles. Camps were set up by the strikers, wherever possible, close to the mines, so that strikebreakers would have to pass these colonies to get to work. On the other hand, the operators, anticipating trouble, hired guards to defend the properties. These mercenaries were equipped with arms and ammunition, although the operators have contended that the strikers were, at the very beginning of the struggle, provided with weapons. Strikers and militia soon clashed. At least four "battles" were reported during October and November, 1913, and in these several were killed. On the 29th of October the militia arrived, and until the spring of 1914 comparative peace was maintained. The miners held that the make-up of the militia gradually changed until it included many—if not most—of the companies' hired men. As a result, the feeling between the militia and strikers became intense, and on April 20 there occurred another armed conflict. The tent colony at Ludlow was burned, and 11 children and 2 women, who had hidden in caves, were found suffocated. There were other conflicts in the next few days, and Federal troops were finally called to the scene, and order was again brought to the regions affected by the strike. These troops were not recalled until the opening of 1915, when matters had already been settled.

In February a Congressional committee investigated conditions in Colorado; and after the termination of the dispute the Federal Industrial Relations Commission held hearings in which many interesting facts were brought out. After several attempts at mediation had failed, President Wilson appointed a commission which submitted a plan for settlement—the main feature of which was a three years' truce—but the operators promptly rejected it, although the miners readily accepted. The strike was ended in December when the strikers went back to work without gaining their point.

ATLANTA TEXTILE STRIKE. A bitter industrial dispute begun in early summer was the strike of the employees of the Fulton Bag and Cotton Mills of Atlanta, Ga. The demands of the workers were: (1) the reinstatement of those discharged for joining the union; (2) the elimination of children under 14 from the factories; (3) a 54-hour week for women and children; (4) an increase in wages. Strikebreakers, made up chiefly of negroes and children, were called in, and the Cotton Manufacturers' Association loaned skilled workers who received extra pay to fill the places of those in the conflict. Thus, the employers sought to minimize the effect of the strike. Preceding this strike, there was another which came as a result of the discharge of 72 workers because of their union activity. Many of the strikers were evicted from their homes, which resulted in much hardship and privation.

ARKANSAS COAL MINES. Another violent conflict in the mining industry was that in Arkansas in which Federal troops were called

out to enforce a court order. The trouble first started on April 6, when the Bache-Denman Coal Company decided to operate their mines on the open-shop plan, although union labor had hitherto been employed. A few months later the company filed a voluntary bankruptcy petition, stating that five of their plants had been destroyed. Mr. Franklin Bache, president of the corporation, was appointed receiver, but the running of the mines was made impossible by the rioting of the strikers, which culminated in the blowing up of the mine at Prairie Creek. Work was resumed in November under the protection of the Federal troops. At the close of the year negotiations were opened with a view to selling the mine to the union.

BUTTE, MONT. On June 13, which is Miners' Union Day, in Butte only 500 of the members of the Western Federation of Miners marched on the streets, and they were attacked as they paraded by the majority of the members. The latter then proceeded to the union hall, and blew up the safe, taking over \$1000 from it. A new union, known as the Butte Mine Workers' Union, was organized, and matters were peaceful for a time.

In an attempt to bring about a conciliation, Charles H. Moyer, president of the Western Federation of Miners, came to the scene, but was forced to beat a hasty retreat. Excessive assessments, and the unsanitary and undesirable conditions that exist in the mines were the chief grievances of the rebelling section. They maintained that these conditions existed because of the control of the union by company men. Moreover, the wages of miners have not increased in proportion with the pay in other trades, there having been no change in the scale since 1907. Much rioting and violence occurred and in September troops were sent to Butte, and the city placed under martial law.

WESTINGHOUSE STRIKE. This strike, involving 10,000 employees, started on June 5, for the purpose of obtaining recognition of the union. The employers replied by stating that they intended to keep an open shop, but would not discriminate against unionists. On the suggestion of J. P. Jackson, Commissioner of Labor and Industries of Pennsylvania, the Secretary of Labor appointed Charles W. Mills and Patrick Gilday as commissioners of arbitration, and after many joint conferences a settlement was finally effected.

OHIO MINES. On March 31 nearly every mine in Ohio was closed down because the operators refused to renew contracts with the miners in anticipation of the new law which required the payment of laborers on a run-of-the-mine basis, instead of the screen payment plan which always existed in Ohio previous to this statute. Maintaining that they would be unable to compete with operators in Pennsylvania and Indiana, where the old plan of remuneration existed, and, further, that the United Mine Workers would demand that the same pay be granted as under the old agreement, the managers decided that it was better to close down. The miners signified their willingness to continue their work until the new law came into operation in May. This was, however, rejected by the operators, and a wage parley a few weeks later which attempted to bring about an agreement was unsuccessful. On May 17, a walkout was declared when the operators closed down. One of the companies,

in order to test its constitutionality, brought suit for an injunction to restrain the carrying out of the law. In July there was much violence in the mining districts, and troops were needed to restore order. Towards the close of the year the companies tried to reach an agreement with the miners, but were unsuccessful, and declared their intention of evicting those who would not pay the rent since the beginning of the dispute. At the opening of 1915, the Secretary of Labor delegated former Commissioner of Immigration Daniel J. Keefe and H. Davies to attempt to bring about an amicable settlement. The operators decided to reopen the mines and, it was said, were willing to give the strikers preference for the places.

HARRIMAN LINES. The strike of the employees of the Illinois Central, and Harriman Lines continued through the year. One of the longest industrial conflicts known, this dispute began, or rather became effective, on Sept. 30, 1911. Nonrecognition of the union and refusal to meet the representatives of the workers were assigned as the causes by the strikers. According to the latter, there were about 35,000 involved, including members of the International Association of Machinists, Brotherhood of Railway Carmen of America, Brotherhood of Boilermakers and Helpers, Brotherhood of Blacksmiths and Helpers, and several kindred organizations. There seemed to be no immediate prospects of settlement.

OTHER STRIKES IN THE UNITED STATES. In addition to the strikes noted above, there were a considerable number of lesser troubles, but no extensive disturbances. In New York City, there were 3000 ladies' tailors on strike for higher wages, and in the same city 2000 chandelier workers out demanding better hours and wages; and for similar reasons there were disputes among the knitters, the umbrella makers, and woodworkers. The shoe workers of Lynn also fought for higher wages; and in the shirt industry at Leominster, Mass., the workers opposed an alleged cut in wages, while the garment workers of Boston sought union conditions in the shops. Among other strikes were: one against rules and for better wages among the potters in Atlantic City; one on account of the wage scale of electric workers in Quincy, Ill.; one among cutters in the shoe industry at Keokuk, Iowa, for increased pay; one of the motormen and conductors of the street car lines at Fort Smith, Ark., in behalf of the union. There were also small outbreaks among the boilermakers in New Orleans, the construction workers in East Waco, and iron workers at Dallas, Texas, the garment makers of St. Louis, and the miners in Washington, Pa. Furthermore, there was a lockout of the iron workers in the building trades of Buffalo.

GREAT BRITAIN. There were no strikes which attracted world-wide attention during the year. The dispute of the unskilled workers in Birmingham was settled early in the year (see **ARBITRATION AND CONCILIATION, INDUSTRIAL**); but the unrest amongst the farm laborers continued. The wages of the latter are still very low. Nearly all labor troubles were brought to a close at the inception of the gigantic European War.

With the advent of the new year came the coalheavers' strike in London. These coal-porters and coal-trolley men, about 10,000 of them,

demanding an increase in pay which the employers refused to grant. Since a large proportion of the population of London used coal, this act on the part of the workers in the middle of the winter made quite a commotion. In about two weeks, however, the increase was given, or was promised, and the strikers returned to work.

A lockout, which at many times promised to become national, was that in connection with the building trades. It started with a refusal on the part of the union workers to sign a contract by which the employees agreed to work with nonunionists if required to do so, or pay a penalty of \$5 for every time that they refused. The London Master Builders' Association, which has a very strong organization, maintained that this was necessary to prevent sectional strikes in the industry. This action, however, vitally affected the unionists and they stood their position in spite of the threat of a lockout. Time and again the men of the allied unions, whose members were greatly augmented by the flocking to them of the nonunionists when the lockout was declared, rejected the proposals of the masters although the laborers suffered much privation. Some of the smaller trades were in favor of accepting, but were greatly outvoted. Towards the end of May the London employers requested the National Federation of Building Trades' Employers to take up the case and it seemed for a long time as if a general lockout were imminent. At the outbreak of the war, after the lockout had lasted over six months, it was finally terminated by a temporary arrangement. Almost 40,000 were involved in this dispute.

War also put an end to the marine engineers' strike which had begun to assume great proportions and was several weeks old at the time of settlement. After having tried to induce the shipowners to grant increased rates of pay in proportion to the amounts secured by the seamen and firemen as the result of their huge strike in the past few years, several thousand of the men struck. It seems that they had been omitted when added wages were given to the other employees of the shipowners. As noted above, at the beginning of the hostilities in Germany, this struggle was concluded and, curiously, much of the coal which otherwise would have been shipped from the country, was held for home use. An effective strike, though, was that of 3000 men engaged in repair work for the Cunard Line in Liverpool. On May 29, the laborers were granted a decrease in the number of hours of work after they had been out on strike but a single day.

There were several other minor strikes occurring throughout the country. The Yorkshire coal miners struck late in March, but soon gave up the conflict. Unrest among municipal employees cropped out in London and other cities. The brewery workers, who had in the past lagged behind other laborers, went on strike, demanding an increase in wages.

DUBLIN. A strike begun by the Transport Workers' Union of Dublin under the leadership of James Larkin, in August, 1913, collapsed early in the year. The strike had caused fully 30,000 persons to be thrown out of work, and had resulted in extraordinary privation and suffering. Some relief had been furnished by the British Trade Unions. The strikers returned to work without signing any agreements.

One effect of the strike was an inquiry into conditions which developed such revolutionary feelings. The Dublin Housing Committee reported nearly 28,000 people to be living in dwellings unfit for human habitation. Conditions were declared to be abhorrent both from sanitary and moral points of view, and the blame was placed on the municipal corporation. An extensive building programme in the interests of the working class families was advocated.

SOUTH AFRICA. Labor disturbances in South Africa began in July, 1913, with a violent strike by the Rand miners, were continued by a threatening upheaval among the Hindus in Natal, and still continued in 1914 by a strike of the employees of the South African State Railway. The immediate cause was the laying off of hundreds of employees as a result of a retrenchment policy by the State railway administration. Prompt action by the government immediately followed. Railway stations were placed under guard; reserves were called out; an embargo was placed on arms and ammunition; labor leaders were arrested on the charge of sedition; saloons were closed. The strikers resorted to sabotage by disabling switches and brakes; in January a general strike was called. Premier Botha at once declared the whole country under martial law and called out 20,000 militia. Moreover, hundreds enrolled under local committees of public safety. Extreme repressive measures were resorted to. This military demonstration was said to have cost the government about \$2,000,000. Meanwhile, various labor leaders were taken from prison and dispatched to England without judicial procedure.

Premier Botha and Gen. Jan Smuts, Minister of Defense and Finance, defended the government's action on the ground that the strike was a revolutionary movement and that only extreme measures would have prevented a native uprising, anarchy, and murder. A bill was later introduced to indemnify the government for all its actions under martial law. The labor leaders, however, asserted that the Boers and the capitalists were endeavoring to drive white labor out of South Africa and replace it by native labor. The deported strike leaders made an appeal to the English people. Mr. Ramsey MacDonald, leader of the Labor party, demanded in Parliament that Viscount Gladstone, Governor-General of South Africa, be ordered to refuse assent to the Indemnity Bill. His motion was defeated overwhelmingly. As a result of the strike, the Laborites were mostly victorious in the Transvaal Provincial Council elections; and also in the Cape Town by-election, when the first Labor member was returned to the Union Parliament. The Peace Preservation Bill, which was designed to deal with strike disorders and which prohibited picketing and permitted the deportation of persons convicted of violence, was withdrawn, probably as a consequence of the show of strength by the union.

ITALY. For the general strike occurring in June, see the article on **SYNDICALISM**.

SPAIN. There was a new outbreak of the Rio Tinto copper miners' strike early in the year, and some 12,000 were made idle. A demand for an increase in wages was the cause of the original trouble in these mines which started in April, 1913, and involved 15,000. At first the Rio Tinto Mining Co. refused to arbitrate,

but by the middle of November, 1913, the government induced the management to submit acceptable terms to the men, and the latter returned to work. The dispute in January, 1914, was a recurrence of the earlier struggle, and through the mediation of arbiters the miners were again induced to resume their places. A shipping strike, which greatly interfered with foreign trade, also occurred during the year.

STRONG, ELNATHAN ELLSWORTH. An American clergyman of the Congregational Church, died April 2, 1914. He was born at Hardwick, Vt., in 1832; graduated from Dartmouth College in 1852; studied theology at the Andover Theological Seminary in 1855, and in 1859 was ordained to the Congregational ministry and became pastor at South Natick, Mass. He held that pastorate until 1865, when he became pastor of a church in Waltham, remaining until 1878. In that year he was appointed secretary of the American Board of Commissioners for Foreign Missions, and retained that post until his death. He was the editor of the *Missionary Herald* from 1879, and also edited *Mission Stories of Many Lands*, 1887; *In Lands Afar*, 1897.

STROUT, SEWELL CUSHING. An American jurist, died Aug. 10, 1914. He was born in Wales, Me., in 1827, and received an academic education at Portland. In 1848 he was admitted to the bar and practiced in Portland from 1854 to 1894. In the latter year he was appointed judge of the Supreme Court of Maine, serving until 1908. He received the honorary degree of A.M. from Bowdoin College.

STUBBS, JOSEPH EDWARD. American clergyman and educator, died May 27, 1914. He was born in Ashland, Ohio, in 1850, and in 1873 graduated from Ohio Wesleyan University, after which he studied theology at the Drew Theological Seminary, graduating in 1875. He entered the Methodist ministry, but his life was spent chiefly as an educator. In 1876 he was chosen president of Baldwin University at Berea, Ohio, and in 1894 left that university to become president of the University of Nevada, which position he held until his death. He was a delegate to many great religious conventions, and was a permanent member of the American Commission for the Study of Agriculture, Agricultural Finance, Production, Distribution, and Rural Life.

SUBMARINES. As the submarine has improved in habitability, manageability, speed, radius of action, and certainty of operation, its relative importance in naval war has advanced with great rapidity. In June, 1914, Rear Admiral Sir Percy Scott of the British navy wrote a letter (for fuller details see **BATTLESHIPS**) to the *London Times* on the subject of the "Submarine Menace." In this letter he stated that the submarine had eliminated the battleship, would prevent it from performing its former functions, and would destroy it if it attempted to perform them.

In the great European War, up to the close of 1914, the submarine had by no means fulfilled the expectations even of its moderate advocates. The conditions were very favorable for submarine operations—a tremendous fleet in

a limited area, and its ports at short distances from the enemy's possible submarine bases. Yet five months of war failed to break the British blockade of the German fleet, or even lighten it. Not a single German cruiser had gotten by it in either direction—to prey upon British commerce or to reach the protection of German guns and mines. The following British ships had been sunk by submarine attack: *Formidable* (battleship, 15,000 tons, launched 1898), *Aboukir*, *Hogue*, *Cressy* (armored cruisers, 12,000 tons, launched 1899–1900), *Hawke* (protected cruiser, 7350 tons, launched 1891), *Pathfinder* (light cruiser, 2940 tons, launched 1904), *Niger* (gunboat, 810 tons, launched 1892), and the Germans claimed that one of their submarines sank the *Bulwark* (sister ship to the *Formidable*). Not one of these ships was less than 10 years old, some were more than 20; all except the *Pathfinder* would have been condemned and relegated to the sale list in a very short time had not war broken out. Their age and consequent decreased value was the reason they were so exposed to attack, by being made the supporting line for the destroyers, scout ships, mine layers, mine sweepers, etc.

Several questions naturally arose. Where was the British main fleet? Up to the time of the German attack on the British coast it was probably north of Scotland, and the greater part was likely to be there at the end of the year. Could not the German submarines or air craft find any part of it? Or if found, did their attacks fail? If they did succeed, why had the facts been concealed by the attacking forces? Where were the German submarines? At the end of the year we had heard of only half a dozen. Were the others sunk, scouring the North Sea in vain, or being held for some future grand coup? Where were the British submarines? What rôle were they playing? Were the German vessels hidden beyond their reach? Until these and some other questions could be answered it was impossible to determine the submarine's value, but if we were to judge it solely by its performance during 1914 we must unhesitatingly pronounce it a disappointment. That it could do more than it had done, its few successes indicated, and during future years it might achieve much that its ardent advocates claimed it would.

SUBMARINE DESIGN

TYPES. Two well-defined types of submarines already had been developed by 1914, and a third was receiving some consideration. These were coast submarines, cruising submarines, and submarine cruisers. The coast submarines were from 250 to 500 tons displacement when submerged. They are or should be fitted with numerous tubes and good speed, but only a fair cruising radius (50 miles submerged, 500 miles on the surface). The cruiser submarine is larger, has higher speed, and a much longer cruising radius. There were no submarine cruisers built up to 1914, though all of the larger cruising boats carried 3-inch guns. The nearest approach to the type were the 5000-ton boat suggested by the Russian officers, and the new boat for the U. S. navy which was probably to have a displacement, when submerged, of at least 1500 tons. The following table shows the number of boats built and building

in the various navies in 1914, and the displacement tonnage, when submerged, of the largest boat built, building, or definitely proposed.

Nation	Built	Bldg.	Largest boat
Argentina	860
Austria	8	8	870
Brazil	3	..	400
Chile	2	..	200
Denmark	6	6	1058
France	78	19	890
Germany	27	10	810
Great Britain	85	10	458
Greece	2	1	468
Italy	20	6	820
Japan	18	2	887
Netherlands	8	2	255
Norway	4	1	458
Peru	2	1	850
Portugal	1	8*	600
Russia	26	12	400
Spain	8*	226
Sweden	6	8	1500*
United States	32	17	

* Proposed.

The figures in the foregoing table are to be accepted as approximate only. Details of their submarines are jealously guarded secrets in all navies. Great Britain, Germany, and Russia might, and probably did have, under construction submarines larger than are mentioned here.

ARMAMENT. All large submarines carried guns of 3-inch calibre or greater, and some carried anti-aircraft guns. It was evident that if they were to make serious use of guns, either for protection or offense, they must be much larger and carry heavier pieces, for it was manifest that a submarine's real enemies or objective cannot be injured by the fire of a couple of 3-inch guns. The torpedo of the submarine is likely to take on a character of its own. Since a submarine must approach quite near its objective before firing its torpedo, the range of the latter is comparatively unimportant. The considerable weight assigned to securing long range might well be devoted to increase of explosive charge. Unless this was done the battleships of the near future might be nearly immune to attack, for internal and external armor extending down far enough to cover the whole side to the turn of the bilge was having more than a casual consideration. The very fatal results of the German submarine attacks indicated that the Germans were using torpedoes with large bursting charges or a very violent explosive. If it is thoroughly understood that there is no necessary limit to the size of a submarine's torpedo, the magnitude of the problem of protecting a battleship by nets or underwater armor may be appreciated.

SPEED. The speed of submarines both on the surface and when submerged is, of course, of the utmost importance. It conduces to successful pursuit of the enemy, successful attack, and successful escape. Speed means increased length and depth of hull of the boat and these dimensions are increasing actually and relatively to the beam in all new highspeed boats. A surface speed of 20 knots and a submerged speed of 12 will necessitate a ratio of length to beam of 12 or 13 to 1; and boats in 1914 under consideration or construction were aiming at these speeds.

STEERING. The successful development of the gyro compass added enormously to the safety and efficiency of the submarine. The boat no longer depends upon occasional glimpses from

its periscope for the purpose of determining its direction. The newspaper accounts of the "blind" submarine whose periscope had been destroyed were interesting fiction so far as concerns boats which are fitted with gyro compasses. The gyroscope was also likely to be used as a stabilizer to control rolling and diving.

PROTECTION AGAINST SUBMARINE ATTACK. The protection of surface vessels against submarine attack consisted in speed, watchfulness, and subdivision. It is evident that these were no longer sufficient. Nor was underwater armor likely to prove wholly satisfactory. It seems probable that the submarine must be met in its own element by destroyers which are also submarines; and that as far as possible submarines must be destroyed in their own base harbors. To what extent air craft can hover over, detect, and destroy submarines or bring about their destruction is not yet determined.

SUBWAYS. See **RAPID TRANSIT; TUNNELS.**
SUDAN, ANGLO-EGYPTIAN. An African country south of Egypt under the joint administration of the British and the Egyptian governments. It has an area of 984,520 square miles, with a population estimated in 1911 at 3,000,000. The capital is Khartum, with 18,235 inhabitants in 1909. Khartum North, on the Blue Nile opposite the capital, had 35,285; Omdurman, the former Mahdist capital, on the White Nile, 42,779. Much of the country is fertile and well adapted to the raising of cotton and food grain; in 1913 the imperial government granted a loan of £E3,000,000 with a view to developing the Sudan as a cotton-growing country. A complete project for the irrigation of a block of land in the Gezira has been prepared, comprehending a dam on the Blue Nile at Makwar, a canal about 70 kilometers in length, and the necessary canalization. The 1913 Nile flood was the lowest recorded during a hundred years, being even lower than that for 1912. Water levels through the Dongola province have been two meters below the average of the last few years, with the result that none of the basin has received any water. A plentiful rainfall in Kordofan has compensated somewhat. Under irrigation by artificial means in 1913 were 130,000 feddans; under natural irrigation by flood, 123,000, and by rain 2,050,000. Progress is being made in the work of increasing and conserving the gum forests of Kordofan. Outbreaks of contagious cattle diseases have been unusually numerous.

The imports of merchandise for the year 1911 were valued at £E2,273,949, and the import of specie £E94,364 public and £E192,925 government. Exports, £E1,376,958; reexports, £E74,894; reexports of specie, £E70,416; transit inwards, £E22,723; outwards, £E31,002. For 1912, imports, £E1,967,429; imports of specie, £E45,082 public, and £E248,275 government; exports, £E1,373,119; reexports, £E92,657; reexports of specie, £E1516; transit inwards, £E22,032; outwards, £E24,416. The budget for 1913 balanced at £E1,547,200, and that for 1914 at £E1,644,000. It has been decided to change the form of the estimate, to leave out figures for the local provincial services, a change made necessary by new local taxation ordinance under which revenue and expenditure must be shown separately for each town and rural district. Railways in operation 1911, about 1500

miles; net profits for the year 1913, £E120,380.

The traffic in slaves has been almost entirely suppressed. The smuggling of slaves from Abyssinia and across other frontiers has been greatly diminished, and though cases of kidnapping occur they are always followed up, usually with success.

Lieut.-Gen. Sir Reginald Wingate was Governor-General of the Sudan and sirdar of the Egyptian army in 1914.

SUFFRAGETTES. See **FEMINISM; WOMAN SUFFRAGE.**

SUGAR. There has been much anxiety over the beet sugar industry in the United States, and a determined effort has been made to save it from the tariff in 1916. The area planted to beets in 1914 was 18 per cent less than in 1913, representing a decrease in all the States except Idaho and Utah. Thirteen sugar refineries were reported to have closed down. Early in the fall, as a result of the European conflict, England made a bid for American sugar, and the price advanced. The beet sugar companies informed the growers that the old rate for beets would be maintained in spite of the contracts for the year at a reduction.

The United States Department of Agriculture in November gave returns from the beet sugar factories showing an area of 486,000 acres of beets, with a probable production of 5,147,000 tons of beets and of 664,000 tons of sugar. Willett and Gray estimated the crop (December 10) at 570,000 tons of sugar, as compared with 655,298 tons in 1913, and 624,064 tons in 1912. The same authorities estimated the Louisiana crop of cane sugar at 175,000 tons, as compared with 261,337 tons in 1913.

Soon after the war broke out there was great concern for the next year's supply of sugar-beet seed, which comes from Germany. With the aid of the United States government in preparing the way, representatives of the industry went abroad and purchased 70,000 bags of seed, at a cost with all expenses less than American factories have been paying for seed in the past. This enterprise, it is thought, will assure, in 1915, the largest crop of beet sugar ever produced in the United States.

In consequence of the cutting off of the British supply of beet sugar from Germany, Austria, and Belgium, the British government purchased, in the fall, 900,000 tons of raw sugar in Demerara, Java, Mauritius, and elsewhere. This is reported to be by far the largest purchase of sugar ever made, and it is to be sold virtually at cost to the refiners, who agree to sell it at a fixed price based on the cost, plus a fair manufacturer's profit.

The world's sugar crop of 1914, as estimated by Willett and Gray (December 10), was as follows: United States 751,000 tons; Porto Rico 325,000 tons; Hawaii 565,000 tons; Cuba 2,600,000 tons; West Indies and Lesser Antilles 294,500 tons; Mexico 110,000 tons; Demerara 100,000 tons; Brazil 200,000; Argentina 200,000; Peru 145,000; Surinam and Venezuela 16,500; Central America, 22,000; British India 2,400,000; Java 1,280,000; Formosa 180,000; Philippine Islands 243,000; Australia and Fiji Islands 342,000; Mauritius 285,000; other African countries 230,000; Spain 10,000; and the beet sugar crop of Europe 5,700,000 tons. This is a total of 15,979,000 short tons of cane and beet sugar, an estimated decrease in the world's

production of 2,634,792 tons. The war has unsettled the export market for German beet sugar, its export to certain neutral countries having been prohibited, and the government has advised the feeding of sugar beets to live stock.

The United States Department of Agriculture published during the year the statistics of sugar in the United States and its insular possessions from 1881 to 1912 (*United States Department of Agriculture Bulletin 66*). This showed a great increase in sugar consumption in the period covered—from 2,500,000,000 pounds in 1881-85 to 7,000,000,000 pounds in 1901-10, while the per capita consumption nearly doubled, averaging 86.85 pounds in 1914. Of the domestic sugar consumption, continental United States supplied, in 1914, 20.6 per cent, the insular possessions 21.9 per cent, and Cuba 57.5 per cent. The United States, with its insular possessions, now ranks among the first four of the sugar producing countries of the world.

SULLIVAN, JAMES EDWARD. An American athlete, official, and publisher, died Sept. 16, 1914. He was born in 1862 in New York City, and was educated in the public schools of that city. From 1878 to 1889 he was connected with the publishing house of Frank Leslie. He founded the *Athletic News*, one of the first athletic papers in the United States devoted to tracking and field athletics, and was also for several years owner and editor of the New York *Sporting Times*. He was the publisher of *Spalding's Athletic Library* and the editor of *Spalding's Official Athletic Almanac*. He started his career as an athlete in 1877, when he entered a walking contest in New York City; this was followed by a long series of victories in walking and running contests. He ceased active competition in sports in 1884, and several years later was one of the organizers of the American Athletic Union, which grew to be the most important athletic organization in the United States. In 1893 he was appointed chairman of the Amateur Athletic Union Committee, which supervised the World's Fair meet at Chicago. When the Olympic games revival was held in Paris in 1900 he was appointed by President McKinley assistant American director, and at the Olympic games of 1904 at St. Louis he was chief of the department of physical culture. He was special commissioner at the Olympic games in Greece in 1906, and in England in 1908. For the help he rendered to the Greek committee at Athens in 1906 he was decorated by King George I with a golden cross of the Royal Order of the Saviour. At the Jamestown Exposition of 1907 he was an honorary director, and he was American commissioner at the Olympic games in 1912. He was a member of the New York City board of education, for many years was prominent in the organization and conduct of games in the city schools, and at the time of his death he was the foremost man in amateur sports in the United States.

SULPHUR. The production of sulphur in the United States in 1913 was 311,590 long tons, valued at \$5,479,849, as compared with 303,472 long tons, valued at \$5,256,422 in 1912. The production of Sicilian sulphur amounted, for the year ending July 31, 1913, to 346,213 long tons. Thus the United States is rapidly gaining on Sicily, which, at the present time, is the leading sulphur-producing country in the world. Sulphur, in 1913, was produced in three

States, Louisiana, Texas, and Wyoming, the chief production being from Louisiana. The total quantity of sulphur imported to the United States in 1913 was 22,605 long tons, valued at \$448,564, and there were exported 89,221 long tons, valued at \$1,599,761. For sulphur as a plant food see HORTICULTURE.

SUN YAT-SEN. See CHINA, *History*.

SURGERY. The cutting or wounding of the vagus nerve has generally been regarded as a grave accident when occurring during a surgical operation, but Exner and Schwarzmenn have severed the nerve in a number of cases for the relief of gastric crises in locomotor ataxia. They report many experiences which show, apparently, that the vagus forms a portion of the reflex arc which is involved in the production of these pains, and by severing the nerve this arc is interrupted and the pain relieved. On this assumption 14 cases have been operated upon with the result that 7 of the patients were completely relieved from their crises, 2 cases improved, and 2 were negative. None of the patients appeared to be injured by the operation. In another series of 6 cases, in which the operation was performed by other surgeons, 3 cases were cured, 1 case not benefited, and 1 made worse. Another operation with the same object in view, which has been noted in previous issues in the *YEAR BOOK*, consists in the resection of the posterior spinal nerve roots. The percentage of cures under both methods is about the same, namely, 50 per cent, but vagotomy is the simpler operation. Exner and Schwarzmenn resect about 1 cm. from the vagus on each side.

Spinal surgery, especially that type connected with tuberculosis of the spine, shows a constant improvement in results. During the past year or two efforts have been made to shorten the period of wearing braces and other orthopedic apparatus by the implantation of bone splints (Albeer's operation). It is to be noted that the diseased area itself is not touched, the operation consisting in the formation of an artificial groove in the spinous processes of the vertebrae and the insertion therein of a thin stick of bone taken from the tibia. The transplant is about five inches long, and is sutured into position by strong catgut and silkwormgut. The operation is more suitable for adults than for children, but in the latter it is claimed that the period of treatment is shortened several months to a year, when this operation is successful. There is always the chance, however, that the transplanted bone may not live or may suppurate.

The controlling of hemorrhage in large organs, such as the liver, brain, kidneys, etc., has always been a difficult matter, and various experiments have been made to improve surgical technic in this direction. Bowman advocates the use of flaps of adjacent tissue, whether muscle, fascia, or omentum, which flaps may be used with a pedicle or may be detached entirely from their natural situation. It is not known whether the undoubted efficacy of such flaps is due to chemical or mechanical action, or to both. The older methods of controlling hemorrhage by tampons, ligatures, and sutures were unsatisfactory because of the degeneration, and sometimes necrosis, which they produced in the neighboring tissues. Experimental wounds were made by Waljoshke and Lebedew on the kidneys,

liver, and spleen of dogs, and these wounds tamponed with fascia. From their subsequent post-mortem findings they conclude that fascia acts as a living tampon, controlling active bleeding and subsequent hemorrhage; that it simplifies suturing, and avoids the necessity for placing deep sutures; that this material is non-irritating to the organ and does not produce degeneration or interfere with function afterward.

INTESTINAL STASIS. There was a marked tendency on the part of surgeons to regard this condition as a purely surgical problem. According to Sir Arbuthnot Lane, who coined the expression, "intestinal stasis" is a stoppage or retardation of the passage of the intestinal contents at certain points in consequence of the presence of angulations, kinks, knuckles, or constrictions of the gut brought about by the growth of fibrous bands or peritoneal processes. Lane and his followers regard the intestinal canal merely from the standpoint of drainage, and attribute the indefinite congeries of symptoms denominated autointoxication to retention and absorption of fecal poisons. The origin of the bands above alluded to is not settled. They have been considered as developmental, as products of inflammation in neighboring organs, i.e., the gall-bladder, liver, and appendix, and as a result of low-grade bacterial infection within the gut itself. Different bands have been described by several surgeons in relation to various parts of the intestine, and they are variously known as "Jackson's membrane," "the bloodless fold of Treves," "Lane's kinks," etc. Surgeons claim that by severing these constrictive bands, and restoring the normal patency of the intestinal canal, intestinal stasis, and consequently autointoxication, is entirely relieved, unless there be insufficiency of the ileocaecal valve. "Short-circuiting" of certain parts of the bowel which are redundant, or which are apparently useless, from their malposition or their pathological condition, is also practiced by many surgeons. It means the resecting of a greater or less length of the bowel, and suturing the severed ends together. Diagnosis is largely made by means of the X-ray after the patient has ingested bismuth to render the intestine opaque to the rays. Operation, however, is not advised in every case in which the X-ray reveals malposition, or kinks, or angulation. About 80 per cent of these cases, it is said, are relieved by the administration of liquid vaseline, Russian mineral oil, etc., and the wearing of a proper abdominal support. It is only fair to say that many internists scout the whole theory of Lane and his followers, and vigorously combat surgical interference in such cases, except where there are very definite pathological lesions present. They point out that the intestines may be matted together extensively after peritonitis, and yet the patient show no sign of autointoxication; also that many individuals suffer from so-called intestinal stasis, and even obstinate constipation, without the production of autointoxication or apparently any interference with their general well-being. Consult Bainbridge, "Significance of Intra-Abdominal 'Bands,' 'Veils,' and 'Folds,'" *Boston Medical and Surgical Journal*, Feb. 19, 1914.

SUTTNER, BARONESS BERTHA VON. An Austrian peace advocate and writer, died June 21, 1914. She was born in Prague in 1843, the

daughter of Field Marshal Count Franz von Kinsky. Her uncles were generals in the Austrian army and one of her ancestors was the warrior-poet, Theodor Körner. When a girl she was betrothed to Prince Adolph von Wittgenstein, but he died before the wedding day. When she was 35 years of age she fell in love with Baron Gundacar von Suttner, but the parents of both opposed the marriage and the couple eloped, going to the interior of Russia on their honeymoon, which took place in 1878, and there starting to work for a living. They became reconciled to their families, and although both were wealthy they continued to devote the greater part of their time to writing and study. Before her marriage the Baroness had already produced one book entitled *The Inventory of a Soul*, this was followed in 1890 by *Die Waffen Nieder* ('Down with the Arms'), a book which aroused all Europe to the horrors and iniquity of war. It was read by Count Muravieff, the Russian Foreign Minister, and he was so impressed with it that he called it to the attention of the Czar. Nicholas II read it, and, it is said, was so impressed that he issued the call for the peace conference at The Hague, in which all nations participated. The publication of this book put Baroness von Suttner before the world as one of the greatest advocates of world peace. She followed up her advantage in other books in which she argued that war is never justifiable. She edited a monthly magazine called *Die Waffen Nieder*, which was the organ of the International Peace Bureau in Berne, Switzerland. Baroness von Suttner was a warm friend of Alfred Nobel, and it is said that when he founded the peace prize he had her in mind, and in 1905 she was awarded it. The Baroness attended the peace conference in Boston in 1904 and again visited the United States in 1912, remaining for almost six months. Her husband died in 1902. In addition to the works mentioned above her writings include: *Schach de Qual* ('Check to the Pain') (1897); *Martha's Kinder* (a sequel to *Die Waffen Nieder* (1902); *Letters to a Dead Man* (1904); *When Cocks Fly Upward* (1914).

SVERDRUP RELIEF EXPEDITION. See POLAR RESEARCH, Arctic, section *Frans Josef Land*.

SWAMP LANDS. See DRAINAGE.

SWAN, SIR JOSEPH WILSON. An English inventor, died May 27, 1914. He was born in Sunderland in 1822. After serving an apprenticeship with a chemist in that city, he became a member of a manufacturing firm in Newcastle. This firm made photographic plates and Swan's experience resulted in the first rapid dry plate and in the first commercially practicable process for carbon printing in photography. He was one of the first to attempt the construction of an electric lamp using a filament of carbon. His first lamp of this kind, the filament being of carbonized paper, was made in 1860, nearly 20 years before Thomas Edison produced his first successful lamp of a similar type. Sir Joseph also conducted experiments and developed new methods in connection with the measurement of electric currents and improved accumulators. He was elected a member of the Royal Society in 1894 and was knighted in 1904.

SWARTHMORE COLLEGE. An institution for higher education, founded at Swarthmore, Pa., in 1869. The enrollment in all departments in the autumn of 1914 was 434, and the

faculty numbered 48. Dr. George A. Hoadley, professor of physics, retired after 25 years of service, and Dr. Harvey C. Hayes was appointed to fill the vacancy. The college received during the year three gifts amounting to \$71,891. The productive funds amounted, at the end of the collegiate year 1913-14, to \$1,615,164, and the income to \$289,689. The library contains 26,000 volumes. The president is Joseph Swain, M.S., LL.D.

SWAZILAND. A British South African protectorate, covering approximately 6536 square miles. Colored inhabitants numbered 98,876 in 1911, whites 1083. Gold (13,011 ounces, valued at £55,266 in 1912-13) and tin (385 tons, valued at £37,946) are mined. There are about 59,000 cattle, and 170,000 native sheep in the country. No trade statistics are kept, Swaziland being included, for customs purposes, with the Union of South Africa. Revenue 1911-12, £58,437; expenditure £58,543; debt March 31, 1913, £100,000. The paramount chief is Sobhuza, under the regency of Nabotabeni, widow of Nbandini. The resident commissioner was R. T. Coryndon, in 1914.

SWEDEN. A constitutional monarchy of northern Europe, occupying the eastern part of the Scandinavian peninsula. The capital is Stockholm.

AREA AND POPULATION. The area in square kilometers, the population according to the census of Dec. 31, 1910, and the population according to the estimate of Dec. 31, 1912, are given by prefectures in the table below.

	Sq. kilometers		Population	
	Land	Water	1910	1912
Stockholm *	107.65	5.78	842,828	850,955
Stockholm	7,414.07	849.07	229,181	242,792
Uppsala	5,120.87	192.44	128,171	180,529
Södermanland	6,287.55	578.51	178,568	180,921

				5,604,192

* City.

Of the total population in 1912, 2,740,737 were males and 2,863,455 were females. The rural population totaled 4,169,960, and the urban 1,434,232. Some of the principal cities, with their population at the end of 1912 were: Stockholm 350,955 inhabitants; Göteborg, 173,875; Malmö, 92,338; Norrköping, 46,674; Gäyle, 35,838; Hälsingborg, 33,863; Örebro, 32,075; Eskilstuna, 28,729. Marriages 1912, 32,993; living births, 132,150; deaths 79,251 (preliminary figures).

EDUCATION. Primary instruction is free and compulsory, and the schools are maintained by local taxation with State aid. The system is efficient, the schools are well attended, and illiteracy is uncommon. There are well developed secondary and special schools, and universities at Lund and Upsala, besides private faculties. The Lutheran is the national creed, but all others, with the exception of Mormonism, are tolerated.

PRODUCTION. About 49 per cent of the people are engaged in agricultural pursuits, mostly in the southern portion. Of the total area, 21,623,608 hectares were under forest in 1911, 3,654,925 under cultivated plants, 1,305,628 in natural pasture, 45,719 in gardens, and 14,405,480 hectares uncultivated lands. In 1906 the farms under cultivation numbered 255,361, of which 81,900 were of 2 hectares (1 hectare = 2.471 acres) and under; 224,599 of from 2 to 20; 33,548 of from 20 to 100; and 3239 of more than 100. The public forests are mostly owned by the crown. In the table below are given area devoted to principal crops in 1912-13 and 1913-14, production for both years, and yield per hectare in 1912-13.

	Hectares		Quintals		Qs.
	1912-13	1913-14	1912-13	1913-14	
Wheat	104,900	104,900	2,589,180	2,092,527	24.2
Rye	400,100	400,100	5,655,880	5,148,587	14.1
Barley	176,800	176,800	3,682,110	3,210,156	20.8
Oats	789,900	789,900	14,488,290	10,498,674	18.3
Potatoes	152,800	152,800	20,511,810	15,687,566	184.2
S. beets	28,006	28,006	8,451,700	9,528,847	801.8

The figures for 1913-14 are subject to revision.

At the end of December, 1911, there were in the country 588,485 horses (493,322 over 3 years old, 95,163 under 3 years), 2,689,609 cattle (1,837,035 cows, 144,277 steers, 52,467 bulls, 655,830 calves and young stock), 945,709 sheep, 66,136 goats, 951,164 swine; in 1900 the horses numbered 533,050, cattle 2,583,555, sheep 1,261,493, goats 79,826, swine 805,805. Dairying is an important industry. In 1910 the creameries

numbered 1416, receiving milk from 80,179 farmers, milk received 1,149,219,973 kilograms; fresh milk sold, 136,969,685 kilograms; butter 32,938,444 kilograms; cheese 10,136,059 kilograms.

The total public forest area was 8,958,448 hectares; total revenue from State forests, 12,744,871 kronor; net revenue, 7,595,749 kronor.

The mineral wealth is considerable. The production of iron ore for the year 1912 was 6,700,565 tons. Output of pig iron 1912, 699,816 tons; in 1913, 735,000. Bar iron 1912, 470,352 tons; 1913, 467,000. Exports in 1912 of iron ore, 5,520,653 tons; pig iron, 204,850; bar iron, 42,980. Output of silver and lead ore in 1912, 2877 tons; copper ore, 3059 tons; zinc ore, 50,036 tons; manganese ore, 5101 tons; sulphur pyrites, 31,835 tons. Gold output 1912, 30,559 kilograms; silver, 961.7; lead, 1,072,889; copper, 3,957,167; zinc, 3,228,231; coal produced, 360,291 tons.

The saw- and planing-mills numbered 1232 in 1910, and the value of their output was 182,456,197 kronor; joineries and furniture factories 519, output valued at 27,058,674 kronor; pulp mills, 166, 95,670,178 kronor; paper and pasteboard mills, 70, 53,885,555 kronor; flour mills, 1364, 106,392,847 kronor; iron and steel works, 658, 94,153,755 kronor; machinery factories, 459, 82,333,521 kronor; sugar mills, 21, 40,289,831 kronor; sugar refineries, 10, 65,099,661 kronor.

COMMERCE. In the table below are shown imports and exports of merchandise, and precious metals for 1911 and 1912, with comparative figures for 1900.

	1910	1911	1912
Imps. mdse.	525,556,596	690,449,526	782,897,586

Various	9,651,825	8,118,204
Total	782,897,586	760,469,404

The principal countries of origin and destination follow, with the value of their trade in thousands of kronor: Germany, 275,423 im-

ports, 170,999 exports; United Kingdom, 192,210 and 222,795; United States, 60,458 and 32,149; Denmark, 53,820 and 67,508; Russia, 33,395 and 27,030; France, 33,298 and 53,228; Norway, 25,357 and 42,979; Netherlands, 19,816 and 18,949; Brazil, 15,553 and 2485; Argentina, 15,504 and 9405; British India, 6993 and 5955; Finland, 18,872 and 14,963.

The merchant marine Dec. 31, 1911, included 1539 sail, of 154,968 tons, and 1219 steamers, of 610,100 tons and 481,805 horsepower; a total of 2758 vessels, of 765,068 tons. There were entered at the ports in the 1911 trade, 36,241 vessels, of 11,634,258 tons; cleared, 36,318, of 11,756,389 tons.

COMMUNICATIONS. During 1914 the Swedish government was approached by Russia in reference to connecting the railway systems of the two nations by a bridge at Karungi on the river Torneå, which forms the frontier between the two countries, the eastern part of the city, which is on both sides, belonging to Finland. During the year there was under construction a railway between the city of Torneå and Finnish Karungi opposite the terminus of the Swedish railway system. The matter was to be placed before the Swedish Riksdag.

The war lent increased interest to any scheme for traffic across Sweden to Russia, as the Baltic was practically closed. New regular lines were started between Stockholm, Gelle, and Finland, while Bjorneborg was anxious to obtain a connection with Gundswall. At the end of the year the railroad circling the Gulf of Bothnia on the Baltic Sea was virtually completed, but a small gap over which passengers had to drive, remained in the line from Stockholm to Petrograd. The Russian line extended to a point opposite the Swedish station at Karungi, where passengers left the train and crossed a half mile over the frozen river Torneå. This was to take the place of the previous journey between the towns of Torneå and Haparanda, a distance of 10 miles, and at the end of the year 500 or 800 passengers were making the trip daily, and heavy freight was being moved, as the steamship travel between the Swedish coast and Russian ports was becoming uncertain.

The section from Kiruna to Riksgränsen of the line from Luleå, Sweden, on the Gulf of Bothnia to Narvik, Norway, on the Atlantic Ocean, 293 miles in length was electrified, and the work practically completed during the year 1914. This line runs through an uninhabited country, where temperatures of from 25 to 35 degrees below zero are common in January and February, and to increase the transportation of iron ore of which 3,000,000 tons were hauled in 1913 by steam, it was determined to electrify the line, and use heavier trains by securing an average increase of about 25 per cent speed. The power is transmitted at 80,000 volts to four special stations, where it is stepped down to 15,000 volts for the trolley line.

The State railway lines in operation at the end of 1912 had a total length of 4683 kilometers; private lines, 9589 kilometers—a total of 14,272 kilometers. The State telegraph lines had a total length of 10,419 kilometers; wires, 32,347. Railway telegraph lines, 10,564 kilometers; wires, 28,041. Wireless stations numbered 5, and 29 on board vessels. The urban telephone systems had 151,843 kilometers of

wires, and the interurban 139,108. Post offices, 3790.

ARMY. Events in Europe aroused general interest in the government scheme for strengthening the home defenses of the kingdom, and as a result, on Sept. 12, 1914, the Riksdag passed a decree changing the requirements of compulsory service, making the time of liability for compulsory service from 20 to 42 years of age, so as to furnish the first calling out of recruits with three additional annual classes, with the result that the first call would altogether comprise 11 annual classes, and thereby when called out they would insure a reserve battalion for each infantry regiment. This legislation provided for the extension of the training time of the infantry from the former period of 240 days to 340 in the line, which was divided into a first training period of 250 days and an extra training period of 30 days during each of the second, third, and fourth years. Conscripts, trained as reserve noncommissioned officers in order to complete the requirements of the mobilization of the infantry, must do 400 days' service. The period of service and general qualifications for the cavalry, field artillery, and troops of engineers were not changed. These men serve one year in the line, as also do those in the position and fortification artillery. Provision was made for training students and other young men, and the reserve was to be organized no longer on a paper basis, but regularly drilled. The artillery and technical troops were to be increased, each to be mobilized for a period of 15 days during the 9th and 10th service years, while the other special arms were to be drilled 25 days during the 5th and 6th years, and the territorial troops were to get a training of 5 days, so that they might be called upon by the king as a protection to the mobilization of conscripts, or sent to points especially threatened. Increased pay was to be awarded for service. Another innovation was the democratization of the army, making it easier for noncommissioned officers to get commissions, and the number of reserve officers was to be increased by 50 per cent. The new scheme of organization applied most especially to the strengthening of the infantry. Regiments were to be provided each with a company having 6 machine guns, and to be supplied with a battalion of the line of the conscripts first called, and 2 reserve battalions from the cavalry brought out at the second call. In connection with these reserve organizations the permanent cadres of officers were to be increased. One squadron from every large cavalry regiment was to be ordered to Noorland, where they were to form a cavalry corps, and every cavalry regiment was to be provided with a machine gun section having 2 machine guns. The organization of the artillery was to be changed, and new engineering corps were to be founded as well as the old.

Two extra generals were to be added to the army and 12 chiefs of infantry regiments during times of peace were to be chiefs of infantry brigades with extra pay. The General Staff was to be increased by about $\frac{1}{5}$. The entire cost of the land defense after the army had been fully organized was to be increased by over 9,000,000 kronor to 64,500,000 kronor. The new army organization was to be carried through within 10 years from Jan. 1, 1914.

NAVY. The effective fleet in 1913 included 12 coast-defense vessels, of 42,600 tons; 1 armored cruiser, 4100; 10 protected monitors, 7200; 5 torpedo gunboats, 4000; 4 gunboats, 1850; 8 destroyers, 3450; 31 first-class torpedo boats, 3100; 22 second-class torpedo boats, 1300; besides submarines, school ships, dispatch boats, etc. Building, 1 coast defense vessel of 6800 tons displacement and a speed of 22.5 knots, 5 torpedo boats, and several submarines. Personnel, about 7500 of all ranks.

FINANCE. The unit of value is the krona, worth 26.8 cents. The 1914 budget balanced at 273,739,700 kronor; 1913 budget, 263,027,200; 1912 budget, 257,196,700. Actual receipts in 1912 amounted to 273,067,808; actual expenditure, 307,729,458. The public debt stood Jan. 1, 1913, at 602,199,692 kronor.

GOVERNMENT. The King is the executive acting through an executive council. The legislative body is a Riksdag, composed of an upper chamber of 150 members elected for six years, and a lower chamber of 230 members elected for three years. Reigning sovereign in 1914, Gustaf V, born June 16, 1858. He married Princess Victoria of Baden, and succeeded to the throne Dec. 8, 1907. Heir-apparent, Prince Gustaf Adolf, born Nov. 11, 1882. He married Princess Margaret of Great Britain and Ireland June 15, 1905. The ministry is given under *History*.

HISTORY

DEFENSE QUESTION. The Riksdag was opened on January 16 with a Speech from the Throne foreshadowing bills to strengthen the national defense, to grant the parliamentary franchise to women, and to regulate the liquor traffic more effectively. State subventions were proposed for the extension of State railways, for the provision of a floating dock at Gothenburg, and for the improvement of marine communications with Great Britain. A special tax was proposed for the reorganization of the defense forces. The movement in favor of militarism, indeed, soon overshadowed all else. A Parliamentary Committee, after investigating the whole question, urged the creation of a larger navy, the adoption of a longer term of service in the army, and the imposition of a special defense tax. On January 26, Admiral Lindman, on behalf of the Opposition, proposed a programme which called for the construction of three battleships, two destroyers, and three submarines, at a cost of about 7,500,000 kronor in addition to the sums already appropriated for naval purposes. On February 6, a monster-delegation of peasants petitioned the King in favor of strengthening the defenses immediately, and obtained the King's assurance that he was heartily in sympathy with their desires. Several thousand trade-unionists made a counter-demonstration, declaring their opposition to militarism; they were informed by the Premier that a certain measure of warlike preparation was absolutely indispensable.

THE CABINET CRISIS. It had already been observed that whereas the King in his speech to the peasants had favored the immediate lengthening of the term of military service, the Premier, speaking to the trade-unionists, deferred the army question until new elections should have expressed the country's verdict. The difference of opinion speedily developed into a

serious antagonism between monarch and premier. The Premier insisted that the King had no right to express in public convictions which were notoriously at variance with the intention of the ministry in regard to the defense question. The King, on the other hand, maintained that he had the right to speak out freely in behalf of what he considered to be vitally necessary for the nation; he had only expressed his personal views, and the cabinet had not yet formally advised him of its intentions. The outcome of the controversy was the resignation of Karl Staaff and his cabinet, February 10. Cheering crowds and a student procession manifested approval of the King's firm stand. In the formation of a new cabinet, the King's first choice, the Liberal Senator Baron Louis de Geer, was unsuccessful, as no Liberals would co-operate; the King then called upon Kunat Hammarckjöld, who formed a "National Defense Ministry," February 17, as follows: Premier and Minister of War, K. Hjalmar L. de Hammarckjöld; foreign affairs, Dr. K. A. Wallenberg; justice, B. F. E. Hasselrot; interior, O. F. de Sydow; finance, A. F. Vennersten; marine, D. Bröström; worship, K. G. Westman; agriculture, J. (Baron) Beck-Friis; military expert, Col. B. B. E. Mörcke; without portfolio, S. F. Stenberg and S. N. Linnér. Imitating the French parliamentary practice, the new ministry inaugurated its career by reading a declaration of policy before the houses of Parliament. The new ministry declared its mission to be the preparation of defense proposals which would be submitted to the people in a general election as soon as possible; so far as it lay in the cabinet's power, party lines would be disregarded. Naturally the Socialists and the Radicals in the lower house vehemently attacked the ministerial declaration. In accordance with its promise, the government dissolved the Riksdag on March 5, in order to obtain a national mandate for the following programme: (1) The length of service in the infantry was to be extended to 340 days, which would be divided into one long period of 250 days, and three short periods of 30 days each. (2) The fleet was to be increased by 2 new divisions of 4 ships each, for coast defense, with heavy guns and high speed; 16 destroyers; 2 divisions of submarines; and 2 divisions of torpedo boats. (3) The cost was to be defrayed without having recourse to loans, by levying new proportional taxation on large fortunes and incomes.

RESULT OF THE ELECTIONS. The elections which took place from March 27 to April 7 were disastrous for the Liberals. The Socialists, who frankly advocated the reduction of the term of military service to six months, increased their representation from 64 to 73 seats; the Conservative or National Defense party, avowedly militaristic, gained 22 seats; but the Liberals by following a middle course lost 31 seats. As a majority in the new chamber could not be obtained unless the 71 Liberals formed a *blocc* with the 73 Socialists, or unless the 86 Conservatives obtained support from the Liberals, the Socialist leader, M. Branting, offered to coöperate with the Liberals if they would work for the reduction of armaments. The Liberals refused, and the National Defense ministry remained in power.

King Gustaf opened the Riksdag in person, May 19, in spite of his recent illness. In the

Speech from the Throne he urged the adoption of the defense measures, along with the tax on larger incomes and fortunes. The following day Gustaf repaired to Carlsbad, leaving the Crown Prince as Regent. The Defense Bill, introduced into the Riksdag on May 23, embodied the proposals already outlined for the construction of 8 battleships, 16 destroyers, and sundry other craft. The triumph of the King's policy was complete: he had overthrown a ministry which possessed the confidence of the Riksdag; he had set up a new cabinet; he had been upheld by the electorate; and the strengthening of Sweden's defenses seemed assured. New parliamentary elections, held in September, left the Conservative party practically stationary, while, at the expense of the Liberals, the Socialists increased their representation from 73 to 87. The Socialists expected in the near future to concert measures with the Liberals for the overthrow of the Conservative ministry and for the establishment of a Socialist-Liberal coalition cabinet. See **SOCIALISM, Sweden**.

SCANDINAVIAN NEUTRALITY. When the War of the Nations began early in August, Sweden promptly declared her neutrality, and began mobilization, August 4. There were stories of an alliance of Sweden and Norway for mutual aid in the maintenance of neutrality. On December 18, a conference was held at Malmö, Sweden, of the three Scandinavian monarchs, Gustaf of Sweden, Haakon of Norway, and Christian of Denmark. More important, probably, than the courtesies interchanged by the kings, were the consultations of the foreign ministers who had accompanied their sovereigns. Just what the upshot of the Malmö Conference was, it is at present impossible to state with confidence; in all probability the three Scandinavian governments discussed measures whereby they might better defend their neutrality and protect their economic interests during the war; but as regards the international bearing of the Scandinavian agreement, whether favorable or hostile to Germany, a divergence of opinion existed. See also, **INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties**.

SWEDISH LITERATURE. See **SCANDINAVIAN LITERATURE**.

SWIMMING. The swimming records of 1914 prove conclusively that the United States has outstripped the rest of the world in this branch of sport. The most striking figure of the year was undoubtedly Harry Hebner of the Illinois A. C. In free style swimming he established the new record of 1:31½ for 150 yards (7 turns), and lowered the time for 220 yards (10 turns) to 2:21, and of the 440 yards (21 turns) to 5:22½. Hebner also bettered his own world's marks for the regular 150-yard course in a 20-yard pool (1:59%), and in a 75-yard pool (1:55%).

Hebner, with his clubmates—William Vought, Perry McGillivray, and Arthur Raithe—swam 400 yards in 100-yard relays in 3:52½ in a 75-foot pool, and in 3:57½ over a 100-yard fresh water course. Other American swimmers to distinguish themselves were Duke Kahana-moku of the Los Angeles A. C., Ludy Langer of the same club, Barrett Small of the Olympic Club, Bud Goodwin of the New York A. C., and Herman Laubis of the Missouri A. C. Of the long distance swims of the year, the most noteworthy was the *Tribune* Marathon from the

Battery, New York, to Sandy Hook. This race was won by George Meehan of Boston, who swam the 22 miles in 7 hours, 18 minutes, lowering the record by one hour.

Yale for the second successive year won the intercollegiate team championship. Paul Roberts of Yale won the 50-yard and 100-yard races, and Arthur McAleenan of Yale captured the fancy diving event for the second consecutive time. The conference college title was won by the University of Illinois.

SWITZERLAND. A Federal republic of central Europe. Capital, Berne.

POPULATION. According to the census of Dec. 31, 1910, the *de jure* population numbered 3,753,293; *de facto* population, 3,765,123. The area of the 25 cantons and demicantons, with their population as calculated by the Federal Statistical Bureau for the middle of the year 1912, are shown in the table below:

	Sq. km.	Pop.
Zürich	1,724.76	524,590
Berne	6,844.50	654,520
Lucerne	1,500.80	170,680
Uri	1,076.00	22,490
Schwyz	908.26	58,910
Obwalden	474.80	17,460
Nidwalden	290.50	18,900
Glarus	691.20	38,470
Zug	289.20	28,640
Fribourg	1,674.60	141,520
Solothurn	791.51	119,620
Basel-Stadt	85.76	189,940
Basel-Ldt.	427.47	77,740
Schaffhausen	294.22	46,820
Appenzell A.-Rh.	242.49	58,400
Appenzell I.-Rh.	172.88	14,740
St. Gall	2,019.00	310,400
Graubünden	7,182.80	118,790
Aargau	1,404.10	234,450
Thurgau	1,011.60	188,850
Tessin	2,800.90	158,950
Vaud	3,252.00	324,800
Valais	5,224.49	129,880
Neuchâtel	807.80	184,100
Geneva	282.85	158,610
Total	41,828.99	3,881,320

The 1910 census returned 2,108,642 Protestants, and 1,590,832 Roman Catholics. Those speaking German as their native tongue numbered 2,599,194, French 796,220, Italian 301,323, Romansh 39,912, other languages 28,172. The marriages in 1912 numbered 27,843, as compared with 27,809 in 1911; divorces, 1514 (1623 in 1911); births, 95,171 (94,185), of which illegitimate 4592 (4372); stillbirths, 2975 (2865); deaths, 54,102 (59,619). The emigrants in 1913 numbered 6191 (5871 in 1912); of these 4367 (4195 in 1911) went to the United States, 874 to Argentina, 257 to Brazil, etc. The greatest number, 1099, came from Berne. The communal population of Zürich as estimated in the middle of 1913 was 200,600; Basel, 137,500; Geneva, 135,000; Berne, 90,800; St. Gall, 80,000; Lausanne, 69,400; Lucerne, 41,500; Chaux-de-Fonds, 38,600; Winterthur, 25,800; Neuchâtel, 24,100; Bienne, 24,000; Fribourg, 21,200; Montreux, 19,700; Schaffhausen, 18,600; Vevey, 14,000.

EDUCATION. Primary instruction is free, and in the Protestant cantons attendance is enforced. There is no direct Federal control of education, authority being vested in the cantons and communes. Secondary schools are amply provided, and well attended. There are excellent special schools, and seven universities.

PRODUCTION. In the valleys agriculture is

carried on. Of the total area, 32,029.38 square kilometers are classed as productive; of these, 22,653.89 square kilometers are under agricultural and industrial plants, 228.98 under vine, and 9146.51 under forest. The area under main crops, and the yield for two years, with yield per hectare in 1912-13, are shown in the table below:

	Hectares		Quintals		Qs.
	1912-13	1913-14	1912-13	1913-14	
Wheat	42,865	41,600	955,000	928,000	22.5
Rye	24,254	24,800	445,000	454,000	18.3
Barley	5,182	6,100	98,000	116,000	18.9
Oats	32,644	33,700	739,000	757,000	23.6
Corn	1,800	1,100	80,000	29,000	28.1
Vines *	28,000	28,000	264,000	500,000	189.4
Tobacco	820	250	6,020	18.8
Potatoes	55,400	55,400	8,500,000	7,200,000	153.4
S. beasts	792	750	818,800	400.0

* Yield in hectoliters of wine.

The figures for 1912-13 are final, those for 1913-14 are subject to revision.

The final results of the Federal live stock census of April 21, 1911, are compared with those of the census of April 20, 1906, as follows: 144,128 horses (135,372 in 1906), of which 17,498 (17,344) were colts under four years, 157 (156) were stallions, 6424 (5496) were brood mares, and 120,049 (112,376) were general-purpose stock. Cattle, 1,443,483 (1,498,144), of which 796,909 (785,950) were cows, 94,069 (98,358) were heifers over two years, and 164,355 (186,022) under two years and over one, 7345 (7107) bulls over two years, and 18,862 (19,549) under two and over one year, 23,454 (33,897) oxen over two years, and 17,409 (28,144) under two and over one; 188,541 (186,307) young breeding stock, 38,708 (41,392) young beef stock; 93,831 (112,358) calves under one year; goats, 341,296 (362,117); swine, 570,226 (548,970); bee hives, 225,030 (242,544 in 1901). There were placed for hatching in 1913, 335 hectograms of silkworm eggs, producing 30,798 kilograms of cocoons.

There were, in 1905, 242,543 industrial and commercial establishments, and 71,413 home industrial enterprises. Silks, cottons, linen, lace, thread, woolens, leather, gloves, pottery, watches and clocks, and tobacco and snuff are representative manufactures. There were 137 breweries in operation in 1913, with an output of 2,969,200 hectoliters of beer. Total output of cement and allied products in 1913, 785,535 metric tons. The manufacture of butter, cheese, condensed milk, and milk chocolate constitutes an important source of the country's wealth, and great quantities are exported.

COMMERCE. The special trade for three years is given in francs in the table below:

	1911	1912	1913
Imps. mdse. 1,802,858,995	1,979,100,604	1,919,816,280	
Imps. pr.			
meta. ...	41,484,268	60,829,609	58,054,945
Total imp.	1,844,343,263	2,039,930,213	1,977,871,225
Exps. mdse. 1,257,809,404	1,357,616,671	1,376,899,116	
Exps. pr.			
meta. ...	81,528,818	88,118,057	84,409,778
Total exp.	1,288,888,217	1,390,734,728	1,410,808,899

Certain details of the special trade for two comparative years will be found in the table which follows, values in thousands of francs:

Mdes.	Imports		Exports	
	1919	1918	1919	1918
Cereals	236,460	243,103	6,869	6,524
Fruits and vegetables	42,012	53,110	6,492	1,285
Colonial produce	113,721	111,463	55,657	58,540
Animal food substances	115,675	98,344	118,717	121,349
Tobacco	16,100	15,628	4,207	4,055
Beverages	53,238	61,975	869	805
Animals, living	72,661	60,406	15,887	11,222
Hides and skins	56,804	55,417	39,343	47,271
Timber	50,033	42,799	7,488	8,368
Cotton goods	123,709	126,082	270,906	260,986
Linen, hemp, etc.	24,048	22,725	8,654	4,665
Silk goods	177,477	178,254	278,233	271,018
Woolen goods	77,943	74,084	24,591	23,994
Clothing, ready made	55,885	57,038	20,725	22,766
Mineral substances	118,023	121,801	18,905	14,964
Iron work	114,960	104,187	81,823	32,802
Copper work	38,544	35,827	10,205	10,893
Gold & silver bullion	99,563	80,012	20,631	20,552
Machinery	54,465	49,664	92,090	98,715
Clocks	2,203	2,630	160,603	169,210
Chemicals	45,844	47,466	19,174	20,040
Grease, oils, etc.	31,723	28,775	2,427	2,089

Countries of origin and destination are presented below, with the value of their trade (merchandise) in thousands of francs:

	Impe.	Expe.
Germany	647,161	307,029
France	376,834	137,934
Italy	192,623	90,603
Austria-Hungary	122,866	38,662
United Kingdom	116,765	230,005
Netherlands	21,647	11,870
Belgium	88,988	27,620
Spain	80,408	27,280
Rumania	48,217	9,706
Russia	80,226	47,808
Other European	84,017	37,282
Canada	13,900	31,774
United States	33,761	135,672

COMMUNICATIONS. On the first of January, 1912, there were in operation 4917.4 kilometers of railway. The national railways comprehend about one-third of all lines, but their operation has not proved an unqualified success. The rolling stock in 1912 included 1594 locomotives, 4879 passenger cars, and 18,344 freight cars. Passengers carried during 1912, 2,523,874,190; merchandise transported, 1,437,481,565 metric tons. Receipts from operation during 1912, 248,844,972 francs; expenses, 165,038,834 francs—not including extraordinary expenditures, which are not charged in this account. Cost of construction to end of 1912, 1,923,255,656 francs.

During the early part of 1914 Switzerland showed the greatest activity in railway construction of any of the countries in Europe. On the new route between Nice, Cannes, and Turin, progress was being made, and a number of tunnels had already been completed, while others were being bored. This line, which would require some three years more for completion, would reduce the distance between Nice and Turin by 47 miles. The new and direct route via Delle to Lötschberg and Simplon to Italy, piercing the Jura Range by the Grenchenberg single track tunnel, 5½ miles in length, was completed during the year, and makes possible a direct route to Italy. An important mountain line, the Furka railway between Brig and Disentis, was opened in June, and is 60 miles in length, part

of it being on the rack system with gradients of 1 in 14, and 1 in 19. The 5-mile Hauenstein Pass tunnel, connecting Tecknau and Olten, was pierced during the year, but completion of the Mont d'Or was delayed by the inrush of water.

The effect of the war was seriously felt by the various railway systems of Switzerland, and the Federal railways were forced to economize in every possible way. By the end of September there was little international traffic, and the ordinary traffic fell to about one-fourth of its normal amount, while tourist traffic was even more seriously affected, and great losses were suffered by the freight traffic. Work on the second Simplon tunnel was stopped in August, and excavations on the north side ceased on August 4, the masonry over on August 22, while on the south side the work was very considerably reduced as early as August 3, and most of the workmen dismissed. By October but a few employees were retained, merely to insure the safety of the completed and incompleted tunnels. The private railways in Switzerland were quite as seriously affected as the Federal lines, and the traffic on the mountain railways in the neighborhood of Lucerne fell to practically nothing, while in August the Stanserhorn and Rigi-Scheidegg ceased running. The Swiss private railways, which before the war paid about 4 per cent dividend, on an average paid much less during 1914 than in previous years, and the Federal railways suffered so much in August and September by receipts falling off almost 50 per cent, that a winter timetable was put in force with a greatly reduced schedule, designed on account of the small number of tourists expected in the season of 1914-15. The board of directors of the Federal railways resolved to reduce expenditures on the new line to the lowest possible amount, which was less than half of what was originally contemplated in the fall of 1914. The number of passes was to be restricted, the railway uniforms were to be made to wear longer, and various other economies were to be practiced. The Federal railway estimates prepared for 1915 anticipated a deficit for nearly \$6,000,000, whereas in 1913 the balance of receipts over expenditures was about \$345,000, and there should have been a surplus for 1914.

Plans had been prepared for what would be the longest Alpine railway, running from Brig, near the Italian border, to Disentis, connecting the former place with the Federal Swiss railways. This line was to begin at the end of the Simplon tunnel at 2200 feet above sea-level, and pass directly over the St. Gothard tunnel as a surface road, at 4700 feet above sea-level, running at one point 7100 feet, to connect Brig with St. Moritz, through an existing branch line, thus affording a tourist route of surpassing beauty, through the region of the upper Rhone, and the headwaters of the Rhine.

There were in 1911, 442.23 kilometers of tramways in operation, and 423 of funicular railways. State telegraph lines, 3575 kilometers; wires, 26,306; stations, 2291. There were in operation 21,336 kilometers of telephone lines, with 360,425 of wires. Post offices, 1957. Postal receipts for the year 1912, 64,367,567 francs; expenditure, 61,853,679. Telegraph and telephone receipts, 287,037,720; expenses, 283,792,225. Total cost of line construction to end of 1912, 70,842,003 (5,124,384 in 1912) francs.

FINANCE. The unit of value is the franc, par

value 19,295 cents. Actual revenue and expenditure for three years are given below in francs:

	1910	1911	1912
Revenue	166,866,721	172,209,861	102,838,649
Expenditure	161,830,520	172,461,807	100,938,098

The figures for 1911 as given above are the results of the old system of computation; by decision of the Federal Assembly only the net results of administration of the department of posts and telegraphs are to be included, dating from 1911, in the account. According to this new basis of calculating, the revenue for 1911 is 98,044,100 francs, and the expenditure 98,296,046. The details of the budget for 1914 are presented below in thousands of francs:

Revenue	1000 fr.	Expenditure	1000 fr.
Customs, etc.	85,844	Military	45,758
Investments	4,078	Interior	16,640
Military	8,757	Commerce, etc. ...	16,582
Real estate	2,088	Finance, etc.	9,677
Posts & rys.	1,099	Debt	9,314
Justice, etc.	1,094	Justice, etc.	2,853
Commerce, etc. ...	1,067	Administration ...	1,606
Interior	189	Political	1,188
Administration ...	119	Posts & rys.	572
Political	25	Miscellaneous	1,756
Miscellaneous	11		
Total	98,820		105,440

The debt stood Jan. 1, 1912, at 255,130,031 francs.

ARMY. While the neutrality of Switzerland was guaranteed by the Treaty of Vienna of 1815, as a condition indispensable to the peace of Europe, and the general interests of the neighboring countries, nevertheless the inhabitants in 1914 feared some violation of that neutrality, and accordingly the army was mobilized and maintained on the borders. The Swiss army is a national militia in which service is compulsory for each citizen, although the time of service actually required is not of long duration.

Ordinarily a citizen is liable for 13 years' service in the Auszug or Elite, 8 years in the Landwehr, and the remaining years up to the 48th in the Landsturm. This permits of recruit training in the first year of 92 days for the cavalry, 77 days for the artillery, 67 days for the infantry, with repetition courses of 13 days in each of the second to the eighth years. In this way the field army can be assembled over 200,000 strong, 140,000 men being an average strength of the Auszug, and the rest being derived from the Landwehr. The Landsturm consists of about 300,000 men, and is intended for the defense of communications, railways, and interior lines generally. The Swiss military system maintains a permanent instructional staff and the organization is one of cadres that are filled as required.

GOVERNMENT. The executive authority is vested in a Federal council of seven members, elected for three years by the National Assembly, and presided over by the President of the confederation, who, with the Vice-President, is elected for one year by the Assembly from among the members of the council. The legislative power resides in a national assembly made up of two houses. The President for 1914 was Col. Dr. Arthur Hoffmann, born 1857; Vice-President, Giuseppe Motta.

HISTORY. The Sickness Insurance Act, recently adopted by referendum, came into force on January 1. The cantonal governments were

empowered to make sickness insurance compulsory instead of voluntary. Compulsory accident insurance was to come into operation at a later date. The budget debates were marked by opposition to the army appropriation, which amounted to about \$9,000,000 out of the total expenditure of about \$20,000,000 for all purposes. The unfavorable financial condition of the country—signalized by three bank failures in the Canton of Tessin—was alleged as an additional reason why the government should hesitate to spend so large a sum for military purposes. The mobilization of the Swiss army, however, as a result of the War of the Nations, necessitated a still more excessive expenditure, to meet which new taxation was imposed and war loans floated. On December 17, the National Assembly elected the Vice-President, Dr. Giuseppe Motta, a Catholic-Conservative, to hold the office of President for the year 1915, and M. Camille Decoppet, an anti-clerical Liberal, to be Vice-President for the same term. See, also, *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties.*

SYNDICALISM. Syndicalism is that new form of collectivism which advocates the concentration in the hands of the workers of each industry of its own instruments of protection. The name is also applied to the most radical labor movement of the day, which aims at the ending of the present capitalist system. It had its inception in France, and denotes the policy of the Confederation Générale du Travail, and derives its name from the French trade unions, the "syndicats." It has, within the past few years, spread to the United States, South Africa, Austria, New Zealand, Great Britain, and other parts of Europe. It differs from Socialism in that the latter favors political action, while the Syndicalists advocate direct action without parliament or any such body as an intermediary. Further, Socialism appeals to public opinion as a whole, while this more revolutionary movement is distinctly for the working classes. Again, although similar in some respects to trade unions, it aims toward organization of the workers of whole industries rather than those in any class or trade. Direct action, including the general strike and sabotage, are at the basis of this movement. By sabotage is meant a "willful act on the part of the workers intended to reduce the output of production in the industrial field, or to restrict trade and reduce profits in the commercial field in order to secure from their employers better conditions, or to enforce those promised, or maintain those already secured when no other way of redress is open." Destruction or spoiling of materials, the prevention of production, and other similar means are oftentimes resorted to. During 1914 the Syndicalist ideas exerted influence in the South African strike, in the general strike in Italy, noted below, and in the Dublin disturbance. (See *STRIKES.*) In the United States, the I. W. W., which is more active in promulgating these ideas, continued to work among the laborers. See *INDUSTRIAL WORKERS OF THE WORLD.*

ITALIAN GENERAL STRIKE. In the summer of 1914 what was perhaps the first successful general strike occurred in Italy. It had been determined at the annual conference of the General Confederation of Labor of Italy, in April, that a general strike should be called for not less

than 24 hours and not more than 48 whenever a workman was killed by the public authorities as a result of labor agitation. On June 7, the Italian holiday that corresponds to our Fourth of July, an anarchistic demonstration of sympathy for two military convicts was held, and the parade, led by Enrico Malatesta, was fired upon, and three were killed. The next day the executive committee of the Confederation acted according to the decision of the previous conference, calling a general strike. All but the city of Padua obeyed, but most of the government employees remained at their work. For two days industry in Italy was at a standstill. According to the statement of Premier Salandra, more than 100 soldiers and police were wounded, many fatally. While the disturbances were rather widespread, they were most serious in Romagna and the Marches, and for several days a few of the towns in these sections were completely isolated from the outside world. At Ancona Malatesta, there was held a sort of revolutionary tribunal. They conscripted automobiles, and spread the news that the King had left the country. On June 10 the order to return to work was issued, and the next day the greater part of Italy had resumed its normal life. In Romagna and the Marches, also in Milan and Naples, it was not until nearly a week had passed that order was completely restored. The government has since taken steps to prevent a recurrence of any such uprising.

SYPHILIS. See **INSANITY**, and **SALVARASAN**.

SYRACUSE UNIVERSITY. An institution for higher education at Syracuse, N. Y., founded in 1870. The students enrolled in all departments of the university in the autumn of 1914 were 3933, and the faculty numbered 300. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds amounted to \$2,011,648, and the income to about \$500,000. The library contained about 92,000 volumes. The president is James R. Day, S.T.D., LL.D.

TAIWAN. See **FORMOSA**.

TALL BUILDINGS. EQUITABLE BUILDING. During the year work was actively in progress on the Equitable Building, New York City, the largest office building in existence, built on the site of the burned office structure of the Equitable Life Assurance Society. The framework of this building was entirely erected, and the structure was practically closed in at the end of the year, so that it would be in readiness for occupancy in 1915. This building occupies the entire block, Broadway to Nassau Street, between Pine and Cedar Streets, and it differs from other lofty buildings in New York City in that it is not a tower building, but is a normal type of structure, the ground plan being carried up undiminished 36 main stories to the top, with 3 stories below ground. The building is 542 feet high from the Broadway sidewalk to coping, and measures from the level of the normal foundation grillages about 600 feet in height. In structure it is regular in design, with all columns running from the footing to the roof without trusses or other complications of frame, and is composed essentially of columns, beams, and wind bracing. A novel feature is the carrying of the bank vaults in the basement on their own foundations independent of the steel work, thus doing away with the additional weight of the framing, which would have been required to

support them. The area occupied by the building is slightly more than an acre, being 159 feet in average width, and 308 feet in average length, affording a total floor space of nearly 40 acres. The weight of the steel framework was 32,000 tons, which made it considerably in excess of anything hitherto achieved in office building construction. An elaborate scheme of wind bracing was worked out, figured on a pressure of 30 pounds per square foot, over the entire surface from sidewalk to coping. The elevators were in 6 banks of 8 each, in the centre of the building, extending, respectively, to the 13th, 21st, 28th, 33d, 36th, and 38th floors. The architecture of the building is simple, and affords ample light for the many offices. On the economic side the erection of the building was thought to afford additional rather than necessary accommodations in a field already congested, especially in view of the existing depression in business.

BOSTON CUSTOMHOUSE. The city of Boston has an ordinance limiting the height of buildings to 125 feet, so, consequently, that city is not as abundantly supplied with skyscrapers as other American places. During the year there was being completed the United States Customhouse, which, being exempt from the city restrictions, was rising to a height of 325 feet, or about one-half the height of the Woolworth Building in New York City. This building has a central tower with pyramidal top, which furnishes a notable landmark.

TOWER OF JEWELS—PANAMA-PACIFIC EXPOSITION. Quite different from the usual office or tower building was the Tower of Jewels at the Panama-Pacific Exposition at San Francisco. This 435-foot skyscraper on two hinged arches, overtopping the surrounding roofs by 250 feet or more, was the dominating feature of the architectural scheme of the exposition. The steel frame of this structure consisted mainly of six frames parallel to each other, two of them vertical, and the other four battered. The two vertical or interior frames rose to an elevation of 364 feet, being 20 feet centre to centre throughout, while the two exterior frames were battered to meet vertically the interior frames at 335 feet above the base. The tower rose vertically in the form of a cube 120 feet square in plan to a height of 152 feet, being pierced in a north and south direction by a barrel arch, the soffit of which was 119 feet above the court. This great height of vault was made possible by two hinged arches, measuring 126 feet from the bottom hinge to the centre of the lower chord. The main steel frame of the tower supported an exterior shell composed of timber, plaster, and staff, and above the rectangular section it was in the form of a successive series of decks. The tower was decorated by the studding of the exterior surface with thousands of cut glass "jewels," which, glistening in the bright sun or under the artificial lights, furnish a brilliant and dazzling spectacle. Engineering problems involved the proper construction of the steel frame, with stress analysis, calculation of temperature stresses, wind stresses, and various working stresses, in addition to the proper foundations on which cast-iron steel trusses carrying two hinged arches were placed. The architectural design was by Thomas Hastings of New York, and the structural work and substructure were designed by Messrs. H. D. Dewell and

Frank S. M. Harris of the engineering staff of the Panama-Pacific Exposition.

TARIFF. The principal interest in tariff discussion of the year related to the operation of the Democratic tariff of 1913. This revision had become operative in October, 1913, and had put into effect the following principal changes: the free list was greatly enlarged, especially by the inclusion of food products, hides, leather, boots and shoes, lumber, steel rails, and various kinds of mechanical products in which American manufacturers excel; the wool schedule admitted raw wool free, and reduced the rates on woolen yarns, cloths, carpets, stockings, and flannels; the cotton schedule was similarly reduced, and likewise greatly simplified; the silk schedule, including velvets and plushes, was modified primarily by changing the combination of specific and ad valorem rates to ad valorem only, a change in harmony with the change adopted also in the cotton and wool schedules; the iron and steel free list was greatly enlarged; the duty on sugar was reduced, and provision made for its complete elimination May 1, 1916.

A year's working of the new tariff indicated some loss in revenue. This had shown itself at the end of the first four months, and was shown again at the end of seven months. The loss, however, was slight, and showed that great skill had been used in formulating the schedules. There was a decrease of importation of raw and partly manufactured materials; an increased importation of finished manufactures, and of foodstuffs. The steel industry was not affected, the total imports for the first four months being only \$10,000,000, or slightly less than for the same period the year before. Textiles were considerably affected, but not sufficiently to destroy their hold on the domestic market, or even seriously disturb their foreign trade. There had been great fear that European manufacturers would take advantage of reduced rates to dump immense supplies onto the American market; experience showed no evidence of such dumping. In seven months the increase in cotton imports was only 6 per cent. The woolen industry was much more seriously affected by strikes than by the tariff. *The American Wool and Cotton Reporter* declared, about April 1, that the majority of mills were operating full time, and that in some centres there was fear of scarcity of labor. Nevertheless the imports of woolen manufactures increased during the first seven months of the new tariff from \$14,000,000 to \$26,000,000 for similar periods. In the silk industry also gloomy forebodings were not fulfilled.

The Journal of Commerce, after a careful analysis in July, concluded that the tariff changes "had little real effect upon trade or industry"; that they had achieved "a considerable reduction in the burden of tariff taxes" with only slight impairment of the productivity of the tariff as a source of revenue. See FINANCIAL REVIEW.

In France there was much agitation both in Parliament and in the country in favor of retaliation on the ground that the new American law was injurious to French industry.

LINCOLN ON THE TARIFF. Prof. F. W. Taussig of Harvard University, in the *Quarterly Journal of Economics*, disposed of the oft-quoted statement popularly attributed to Abraham Lincoln, that "when we buy manufactured goods abroad we get the goods and the foreigner gets

the money. When we buy the manufactured goods at home, we get both the goods and the money." He showed that the first appearance of this statement was in the *American Economist* of June, 1894, where it was attributed to an Illinois paper of a few days earlier. After following up every clue, Professor Taussig said: "It seems certain that the phrase is apocryphal. There is no evidence that Lincoln ever used it." Moreover, he pointed out, the crudeness of the reasoning would stamp it as an impossible conclusion of Lincoln's great reasoning powers.

CANADA. Schedules of a new tariff were fixed by the government and announced by Minister of Finance White in April. While the new rates were considered satisfactory by the manufacturing interests of Eastern Canada, there was considerable disappointment with them among the farmers of the West. This disappointment was due primarily to the retention of the import duty on wheat. The Underwood tariff, signed by President Wilson in October, 1913, had provided free importation of wheat for those countries granting a like privilege; but the retention of the Canadian duty prevented dominion farmers from shipping to Minneapolis and Chicago. They were thus forced to send their wheat to Liverpool, a result justified by the government because of its benefit to the Canadian railways and milling interests. Some opposition was due also to the contention that the duty on flour forced the Canadian consumer to pay higher prices than the English consumer paid for the same grades.

The farmers had, moreover, desired free agricultural implements, but secured only a reduction of 5 per cent (that is, from 17½ per cent to 12½ per cent) in the duty on harvesters, mowers, reapers, and binders. The retention of this duty was considered a favor to the steel manufacturers of Eastern Canada. The conservative papers argued that the changes on the whole were slight, that the reduction on harvesting machines was a real aid to the farmers, and that the new budget was drawn up with a view to the general benefit of Canadian industrial life.

TASMANIA. An island and State of the Commonwealth of Australia. The area is 26,215 square miles. The census of April 3, 1911, returned a population of 191,211; estimate of Dec. 31, 1912, 197,205. The capital is Hobart, whose population, with suburbs, in 1911, was 39,937. Governor in 1914, Sir William Grey Ellison-Macartney (from March, 1913). Premier and attorney-general, John Earle. See AUSTRALIA.

HISTORY. Unusual importance attached to the parliamentary affairs of Tasmania in 1914, because in the course of the year a question fundamental for the constitution of a self-governing colony—a question of the Governor's prerogative—became a burning issue in Tasmania, and a much-discussed proposition in other British colonies. It came about in this way. Early in the year, a by-election for Denison, to fill the seat of the late Sir George Davies (Liberal), was won by Mr. Sheridan (Labor). The Liberals thus lost their majority of one in the Legislative Assembly, which was now evenly balanced between 15 Laborites and 15 Liberals. On April 1, the Liberals were still further weakened by the secession of one of their number, and the Labor Opposition was able to

obtain a majority of one on a vote of no confidence. The Liberal Premier (Mr. A. E. Solomon) thereupon applied to the Governor for the dissolution of Parliament, and, meeting with a curt refusal, resigned his office. Mr. Earle then formed a Labor ministry. Shortly afterwards Mr. Earle made the sensational declaration that in accepting the office of Premier he had been obliged by the Governor (Sir William Ellison-Macartney) to agree to two conditions: (1) that he should select a lawyer for the post of attorney-general, and (2) that he should at once ask Parliament to agree to an immediate dissolution. Intensely indignant at this infraction of the ministry's independence, the House at once passed the following resolution (April 10): "That in the opinion of the House, the action of the Governor in imposing on ministers, as a condition of appointment, an undertaking to agree to a dissolution of Parliament, whether the House approves of the policy of ministers or not, is contrary to the well-established usage of responsible government, and the House respectfully suggests to his Excellency that such action is undesirable, and that the Speaker be instructed to respectfully request his Excellency to forward this protest, with copies of the conditions, to the King, through the Secretary of State for the Colonies." Mr. Harcourt, as Secretary of State for the Colonies, after some delay sent an answering dispatch, which was read in the Tasmanian House of Assembly on July 8; the position taken by the House was completely vindicated, and a "severe snubbing" administered to the Governor. Mr. Harcourt took pains to state with unmistakable emphasis that the Governor had no right to impose conditions on his ministers, and must always act upon the advice of the cabinet in dissolving Parliament. Having gained its point, the House harbored no resentment toward Sir William Ellison-Macartney, but rather requested him to refrain from resigning his office after being so humiliated.

TAXATION. NATIONAL CONFERENCE. The eighth National Conference on Taxation was held at Denver, Colo., Nov. 8-11, 1914. There were 200 delegates present, representing 32 States and 13 colonies. President E. R. A. Seligman in his address indicated the following as among the fundamental changes in present tax reform: The substituting of real or specific taxes for personal taxes; the transition from local to general taxation; the movement from property to produce or yield as a basis of taxation; the change from benefit to ability in taxation theory; the definition of earned and unearned incomes; movement toward progression in income taxation.

The conference had papers and discussions on the following subjects: Taxation of express companies; taxation of foreign corporations with special reference to license fees; taxation of securities; the Federal income tax law, its simplification and administration; increasing public expenditures and means of their reduction; the single tax, especially with reference to Western Canada and Colorado; taxation of irrigated lands; taxes of metalliferous mines; summary of the activities of State tax associations. The high exemption of the Federal income tax law was severely attacked, and mildly defended. The report of a Committee on Increased Public Expenditures showed that such expenditures have increased more rapidly than population,

wealth, or income; that taxes have become a handicap on industry, enterprise, and investment; that probably a majority of electors pay no direct taxes; that the dispersion of power and responsibility in public finance is a fundamental and costly defect. The next Conference will be held in San Francisco in 1915.

INCOME TAX. Much interest was aroused by the first report of the operations of the new income tax law of 1913. In the ten months from March 1 to Dec. 31, 1913, the income tax produced \$28,253,000 revenue. This was \$26,000,000 below the estimate of the Treasury experts. Secretary McAdoo, being convinced that extensive evasion had been practiced, began measures to detect the missing taxpayers. He requested of all corporations and joint stock companies names of stockholders and records of dividends, and the names and salaries of employees. It was believed that a large portion of the deficit of the year was due to misunderstanding and the failure of the tax machinery to work efficiently. Analysis showed that residents of New York, New Jersey, and Pennsylvania paid nearly 58 per cent of the tax. New York, with only 10 per cent of the country's population, paid 44 per cent of the tax. New York City alone paid 28 per cent of the total. Two Southern States, on the other hand, paid only 3½ per cent of the total yield. The Treasury had estimated that the total number of taxpayers under this law would be about 425,000. The actual number was 357,598, including 79,426 with incomes between \$2500 and \$3333; the latter not having been included in the other estimate, there was a discrepancy between estimate and actual returns of 146,828. Moreover, not a single class of incomes showed as many returns as had been estimated. There were 44 returns made on incomes over \$1,000,000, 91 on incomes between \$500,000 and \$1,000,000; 222 on incomes between \$250,000 and \$500,000; and 1241 on incomes between \$100,000 and \$250,000. The number of returns was in every one of these cases less than half the estimate. There were 14,746 returns on incomes between \$25,000 and \$100,000; 45,606 on incomes between \$10,000 and \$25,000; 101,718 on incomes between \$5000 and \$10,000; 114,480 between \$3333 and \$5000. Returns were made by 278,835 married persons, by 55,212 single men, and by 23,551 single women. The normal tax of 1 per cent produced \$12,728,000; and the surtax on incomes above \$20,000 produced \$15,525,500. Of this latter sum, \$9,607,400 came from incomes over \$100,000.

In his annual report Secretary of the Treasury McAdoo advocated a change in the law, so as to require all persons having a gross income of \$3000 to make a return. Though it did not produce the revenue expected, the Secretary declared it satisfactory. He favored greater power and discretion for the collectors as a means of reducing evasion.

CORPORATION TAX. The corporation excise tax of 1909 was slightly modified and transformed into the corporation income tax as a part of the income tax law of 1913. The law of 1909 continued to March 1, 1913. The report of the Commissioner of Internal Revenue showed that during the fiscal year 1913-14 the excise tax had produced \$10,671,000, and the corporation income tax, \$32,456,000, or a total of \$43,127,000. This compared with \$25,600,000 in 1913, \$28,500,000 in 1912, \$33,500,000 in 1911,

and \$21,000,000 in 1910. The increase in 1913 was attributed to the withdrawal of the \$5000 exemption for each corporation, and the inclusion of holding company profits. Of the total corporation tax, New York paid more than 22 per cent, Pennsylvania 14 per cent, Illinois nearly 10 per cent, while Massachusetts, Michigan, New Jersey, Missouri, Maine, and California each paid large sums. On the other hand, Alaska, South Dakota, Wyoming, and Vermont paid very small sums. The tax returns showed that there were 316,909 corporations doing business in the United States. They reported \$64,071,319,000 capital stock, and bond and other indebtedness of \$37,136,215,000. Their net income was reported as \$4,339,550,000, an increase of \$500,000,000 over the fiscal year 1913. Few cases of failure to make return or of fraudulent return were discovered, though the Internal Revenue officials collected \$2,000,000 more from corporations than the latter's first returns would have warranted.

WAR REVENUE TAX. Shortly after the outbreak of the war it became evident that the falling off of customs receipts added to the failure of the income tax to come up to expectations would necessitate the provision of additional source of Federal revenue. On September 4, President Wilson read to Congress a special message on the problem of providing the \$100,000,000 estimated loss in expected revenues. On October 22 the President signed what was called the War Revenue Act. It was in large part a renewal of the Spanish-American War revenue act, and was expected to produce about \$90,000,000. Among the important provisions of the law were the following: The internal revenue on beer was raised from \$1.00 to \$1.50 per barrel; the rates on wines, champagnes, and similar products were considerably raised; bankers were taxed in proportion to capital; brokers, including commission and customhouse brokers, at a fixed rate per annum; tobacco dealers upon volume of annual sales, and manufactures of tobacco by a sliding scale based on output. The use of adhesive stamps to collect new taxes on bonds, debentures, legal instruments, certificates of indebtedness, and other evidences of ownership of instruments indicating debts, was resorted to. A tax affecting the public at large was the imposition of 1 cent on any telephone call or telegram costing 15 cents or over. Much criticism was directed at this act on the ground that Congress could, by reducing the river and harbor and other so-called "pork barrel" appropriations, secure as much as the new law would produce. On the other hand, Secretary McAdoo showed in his annual report in December that the revenue from customs in 1913 was \$30,138,000, whereas in 1914 it was only \$16,271,000, due solely to a decline in importations.

Bibliography. The following titles were among the more important of the year: S. Chen, *System of Taxation in China in the Tsing Dynasty, 1644-1911*; F. W. Coker, *Administration of Local Taxation in Ohio*; H. V. Cowles and J. H. Leenhouts, *How to Assess Property in Cities and Rural Towns*; W. H. Lyon, *Principles of Taxation*; F. Mathews, *Taxation and the Distribution of Wealth*; H. M. Powell and M. Saxe, *Taxation of Corporations* (2d ed.); H. E. Smith, *United States Federal Internal Revenue History from 1861-1871*; T. P. Whittaker, *Ownership, Tenure, and Taxation of Land*; special

reports of State Tax Commissions in Arizona, Kentucky, and Maryland; National Tax Association, *State and Local Taxation: Seventh Annual Conference*.

The new Federal income tax law called forth numerous guides and expositions. Prof. E. R. A. Seligman issued the second edition of his general treatise, *Income Tax*. The Wisconsin State Tax Commission prepared an explanation of the income tax law of that State.

TEACHER-MOTHERS. See FEMINISM, *passim*.

TEACHING, CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF. See UNIVERSITIES AND COLLEGES, under section entitled as above.

TECK, ALEXANDER AUGUSTUS FREDERICK WILLIAM ALFRED GEORGE, PRINCE OF. A British prince, appointed in 1914 Governor-General of Canada, to succeed the Duke of Connaught. He was born in 1874, the third son of the late Duke of Teck and the late Princess Mary Adelaide, and is the youngest brother of Queen Mary of England. In 1904 he married Princess Alice of Albany, and at the time of his appointment held the rank of major in the Second Life Guards. He saw service in Matabeleland in 1896, and also served in the South African War, winning the D.S.O. and being mentioned in dispatches. Prince Alexander has always taken a great interest in social and philanthropic matters, and his appointment was generally well received in Canada, where it was taken as indication that henceforth the Governor-General will be chosen from members of the royal family. See CANADA.

TELEGRAPHY. See WIRELESS TELEGRAPHY AND TELEPHONY.

TELEPHONY. The telephone industry felt the effects of the prevailing business depression during 1914. The year was notable for the activities of the public service commissions of various States in undertaking plans for the valuation of telephone business with a view to determining the basis for rate-making. In March, a decision was rendered in the Government suit under the Anti-Trust Law against the Pacific Telephone and Telegraph Company, forbidding it to own and control the Northwestern and Interstate Telephone Companies through which the Pacific Company had dominated the telephone service of Washington, Oregon, and Idaho. Valuation of telephone companies was actively pushed in Ohio, Maryland, Missouri, Oregon, and Washington. At the close of the year the New York State Commission had begun hearings for determining the basis of rate-making by the New York Telephone Company. The State commissions of Wisconsin and California adopted and recommended rules for standards of service and construction of telephone lines. The "independent" telephone companies of the United States reported increasing activity and a fair degree of prosperity for the year. As was the case in 1913, the Postmaster General in his annual report for 1914 again recommended and strongly urged the taking over by the government of all telephone and telegraph lines. The use of telephones in place of telegraph instruments for train dispatching on railroads was adopted to an increasing extent in the United States and Canada. The largest long distance or "toll" board in the world was opened early in the year in New York City. This was placed in a building made as nearly fireproof as possible, and was built for 274 "positions," and

designed for extension when necessary to 700 positions. The underground telephone cable that had been completed between Boston, Mass., and Washington, D. C., during the previous year, amply justified its existence during the snow and sleet storms of March 1 and December 7-8, during which overhead wire service was in many places destroyed. Few striking changes in apparatus were to be noted during the year, but there was some increase in the number of automatic and semiautomatic systems in use.

Naturally the war interfered with telephone service in all parts of Great Britain and Europe, but at the end of the year it was reported that the volume of business was beginning to resume normal proportions in those countries. Many ingenious portable devices were made use of by the armies in the field for telephonic communication, portable telephone instruments and accessories becoming an indispensable part of the equipment of every army corps, and field movements were very generally controlled by their use. In India there was a great increase in the extension and use of telephones, there having been 11,000 miles of wire and cable, and 183 exchanges installed in that country during the year.

TELESCOPES. See **ASTRONOMY**, *Large Telescopes*.

TELESCRIBE. One of the notable inventions of the year by Thomas A. Edison, and one which seemed destined to become of great importance in commercial and legal work, was that of the telescribe, an apparatus for recording on the cylinder of an Edison dictating machine a conversation carried on over a telephone line. A person provided with a telescribe, and desiring to record the whole or a part of the conversation to be carried on by telephone, can do so by placing the telephone receiver on the telescribe box, containing the receiving diaphragm of a loud speaking telephone whose vibrations are transmitted to the receiving diaphragm of a dictating machine. There was also a watch-case receiver connected with the telescribe, and used by the hearer. The vibrations of the diaphragm in the telephone receiver, when placed on the telescribe transmitter, are transmitted through its receiver to the recorder of a dictating machine. Placing the telephone receiver on the telescribe box, and the use of automatic switches, puts the dictating machine into circuit, and the recording of the conversation begins. The person using the apparatus, by a simple control, may cause to be recorded only so much as he may desire, at the same time hearing every word that is spoken as in the ordinary use of the telephone. At the close of the year the telescribe was about to be put on the market for commercial distribution, and was expected to be a valuable adjunct to office equipment, where it was important to record any conversation. Its scope and application promised to be very wide.

TELLER, HENRY MOORE. An American public official, formerly United States Senator from Colorado, died Feb. 23, 1914. He was born in Granger, Allegany Co., N. Y., in 1830 and was educated in the common schools and in Alfred University. During the Civil War he was a major-general in the Colorado militia, and after the war he took an active interest in politics which lasted until his death. When Colorado was admitted to the Union in 1876, he became

one of the first United States Senators from that State, remaining in the Senate until 1882 and becoming one of the hardest working members. In 1877-78 he was chairman of a special committee on election frauds, known as the Teller Committee. On April 17, 1882, he was resigned from the Senate to become Secretary of the Interior in President Arthur's Cabinet, serving in this post until the end of the administration when he was returned to the Senate. As early as 1880 he became interested in the silver question, and did much in and out of Congress in favor of bimetallism, being instrumental in inducing the Republican party to make a declaration for bimetallism in the national convention in 1892, and taking a leading part in the long fight in the Senate against the unconditional repeal of the Bland silver act. His stand on the money question made him the acknowledged leader of the silver Republicans, who in the national convention of 1896, strove in vain to commit the party to the doctrine of free silver. On the refusal of the party to accept such a plank in its platform, he withdrew from the convention and from that time ceased to be identified with the regular Republican party. In 1897 he was reelected to the Senate as an independent silver Republican. At the expiration of this term he was again elected to the Senate, this time as a Democrat. In 1909 he was succeeded in the Senate by Charles J. Hughes.

TEMISKAMITE. See **MINERALOGY**.

TEMPERANCE. See **ALCOHOL**.

TENNESSEE. **POPULATION.** The estimated population on July 1, 1914, was 2,254,754. The population in 1910 was 2,184,789.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. bu.	Value
Corn	1914	3,850,000	80,400,000	\$54,672,000
	1913	3,850,000	68,675,000	52,880,000
Wheat	1914	720,000	11,160,000	11,718,000
	1913	700,000	8,400,000	8,232,000
Oats	1914	850,000	8,050,000	4,266,000
	1913	800,000	6,800,000	3,839,000
Potatoes	1914	85,000	1,505,000	1,870,000
	1913	88,000	2,432,000	2,359,000
Hay	1914	800,000	8,960,000	16,320,000
	1913	900,000	1,089,000	17,642,000
Tobacco	1914	77,400	68,468,000	4,760,000
	1913	90,000	64,800,000	5,443,000
Cotton	1914	890,000	8,865,000	11,182,000
	1913	865,000	379,000	23,073,000
a Tons.		b Pounds.		c Bales.

MINERAL PRODUCTION. The most important mineral product of Tennessee is coal, the value of the annual production of which is something over one-third the total value of the mineral products of the State. Second in importance is copper, which represents about 14 per cent of the total, while the stone quarries, chiefly marble, contribute a little less than 10 per cent. The production of copper in 1913 was not materially different from that of the preceding year, showing an increase from 18,483,173 pounds in 1912, to 19,390,750 pounds in 1913; the value decreased from \$3,049,724 in 1912, to \$3,005,566 in 1913. The value of pig iron produced exceeds that of the copper product, but is not included in the total. The production of coal increased from 6,473,228 short tons, valued

at \$7,379,903 in 1912 to 6,903,784 short tons, valued at \$7,883,714 in 1913. The production of coal in 1914, according to the estimates of the United States Geological Survey, was about 20 per cent less than in 1913, or about 5,500,000 short tons. The industry was somewhat affected by the decrease in the demand from the iron furnaces, but probably to a larger extent on account of the falling off in the export of cotton, which reduced purchasing ability throughout the rural communities. Coke is made in considerable quantities. The production decreased from 370,076 short tons, valued at \$951,863, in 1912 to 364,578 short tons, valued at \$925,430, in 1913. All the iron ore mined in Tennessee is used at blast furnaces within the State, the ores being principally hematite and brown ore. In 1913 the ore sold or used amounted to 364,092 long tons, valued at \$493,556. Tennessee is the only State of importance among the Eastern States in the production of copper, and ranks ninth in this respect among all the States, the entire product being from pyritic ores mined in Polk County and smelted at Ducktown. The agitation in recent years against the emission of sulphur-laden fumes from the smelter stacks and the efforts of the operators to control them have resulted in the construction of plants for the recovery in the form of acid of the sulphur contained in the ore. The mining of phosphate rock and the quarrying of stone are important industries, each having products valued at over \$1,750,000 in 1913. The clay products are also important and in the production of ball clay, Tennessee holds first place. One of the significant features connected with the mineral industry of the State in 1913 was the increase in the production of zinc, the recoverable content of the ores mined having increased from 2191 short tons, valued at \$302,310, in 1912 to 5583 short tons, valued at \$625,196, in 1913. Other commercial products are barytes, bauxite, cement, gold, lime, mineral paints, mineral waters, natural gas, sand and gravel, silica, silver, and tripoli. The total value of the mineral products in 1913 was \$21,052,931, compared with \$19,362,209 in 1912.

TRANSPORTATION. The total mileage of steam railroads in the State in 1914 was 4130. The roads having the largest mileage are the Nashville, Chattanooga, and St. Louis, 899; Louisville and Nashville, 861; Southern Railway, 764; Illinois Central, 348; and the Tennessee Central, 292.

EDUCATION. The total school population of the State on June 30, 1913, was 767,585, the total enrollment in the same year being 544,017, and the total attendance 374,331. Of the total school population, 598,496 were white and 169,089 colored, and the figures for enrollment include 433,031 white and 102,670 colored pupils. The figures for daily attendance include 298,434 white and 69,558 colored pupils, the attendance in the county elementary schools being 295,523; in the county high schools, 6341; and in the city schools, 72,467. The total number of teachers was 11,234, and of these 9372 were in the county elementary schools, 392 in the county high schools, and 1470 in the city schools, with an average monthly salary of \$50.44. The average length of the school term is 129 days. The total expenditures for the support of schools for the fiscal year ending June 30, 1913, was \$5,866,870. The per capita expenditure on the basis of at-

tendance was \$15.69. The Legislature of 1913 passed several important measures relating to education, the most notable of which related to providing additional financial assistance to high schools. A new compulsory attendance law has had excellent results, the attendance in 85 counties showing in 1914 an increase of 22 per cent. An effort was made to have the Legislature of 1914 enact laws providing for medical inspection and measures providing for consolidation in the public schools.

FINANCE. The report of the Comptroller of the Treasury for the biennial period 1912-14 showed a balance in the treasury on Dec. 20, 1912, of \$785,120. The total amount received during the two years was \$9,366,870, and the amount disbursed was \$9,779,579, leaving a balance in the treasury at the end of the period of \$172,410. The interest-bearing bonded debt of the State amounts to \$10,781,000. This is all in bonds due July 1, 1915, and Oct. 1, 1915.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the Board of State Charities include the Eastern Hospital for the Insane and the Tennessee Deaf and Dumb School at Knoxville; Western Hospital for the Insane at Bolivar; Central Hospital for the Insane, Tennessee Reformatory, Tennessee Industrial School, Tennessee School for the Blind, and two State prisons all at Nashville; and a branch prison at Petros.

POLITICS AND GOVERNMENT. The State Legislature did not meet in 1914 as the sessions are biennial and the last was held in 1913. Elections were held for Governor, representatives in Congress, and State officers. Governor Hooper, Republican, was a candidate for reelection and in the nominating primaries was renominated, being indorsed by a faction of independent Democrats. The Democrats nominated for Governor, Thomas C. Rye. Both parties indorsed the prohibition laws. At the election on November 3 Mr. Rye was elected, receiving 136,816 votes, compared with 115,821 for Governor Hooper, the Progressives having no candidate in this election. The total vote cast was 254,308, compared with 247,821 in 1912. The majority of Governor Hooper when a fusion candidate in 1912 was 9000. As usual, the Republicans elected representatives in the first and second districts, the Democrats in the other eight.

The important measures for regulating the sale of liquor in the State, passed at an extraordinary session of the Legislature held in 1913, went into effect on March 1, 1914. The most notable of these measures was a so-called nuisance bill, which has for its object the closing of every saloon, gambling house, and disreputable resort of the State. Any ten citizens may institute proceedings under the law. One of the measures passed in 1913 restricted the amount of liquor that might be ordered by citizens from other territory for their personal consumption and family use. The Supreme Court of the State on February 28 decided that a citizen may order as much as he wishes, but the record of receipts must be filed with the clerk of each county. An important feature of the nuisance law is the provision that intoxicating drinks cannot be sold within four miles of a school. This has practically the effect of closing the entire State to saloons. This provision has been in all the temperance laws passed in Tennessee. The four-mile law was applied first to rural dis-

tricts, then to incorporated towns of 2500 or less; and then to the entire State.

STATE GOVERNMENT, 1915. Governor, Thomas C. Rye, Democrat; Secretary of State, R. R. Sneed, Democrat; Treasurer, to be elected; Commissioner of Agriculture, to be appointed; Superintendent of Education, to be appointed; Comptroller, to be elected; Adjutant-General, to be appointed; Attorney-General, Frank M. Thompson, Democrat; Commissioner of Insurance, to be appointed.

JUDICIARY. Supreme Court: Chief Justice, M. M. Neil, Democrat; Justices, A. S. Buchanan, Grafton Green, S. C. Williams, and D. Lansden; Clerk, Joe J. Roach—all Democrats.

STATE LEGISLATURE, 1915.

	Senate	House	Joint Ballot
Democrats	26	73	99
Republicans	7	26	33
Democratic majority	19	47	66

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

TENNESSEE, UNIVERSITY OF. A State institution of higher learning, at Nashville, founded in 1874. The number of students enrolled in the autumn of 1914 was 635, not including students in medicine, dentistry, and pharmacy, and the faculty numbered 183. There were no notable changes in the faculty during the year and no noteworthy benefactions were received. The income of the university at the end of 1914 was \$274,007. The library contained 36,000 volumes.

TENNIEL, SIR JOHN. An English cartoonist, died Feb. 26, 1914. He was born in London in 1820. His art education was mainly self-obtained, although for a short time he was a student at the Royal Academy. He sent his first picture to the exhibition of the Society of British Artists in 1836, and in 1845 submitted a large cartoon entitled "An Allegory of Justice" in a competition for designs for the mural decoration of the new Palace of Westminster. For this latter he received a prize of \$1000, and a commission to paint a fresco in the "Hall of Poets" in the House of Lords. His illustrations for an edition of *Aesop's Fables* attracted favorable comment for their artistic power, humor, and evidences of close observation, and in 1850 when Richard Doyle resigned from the staff of *Punch*, Mark Lemon, then editor, invited Tenniel to join the staff of that journal. His first cartoon was entitled "Lord Jack the Giant Killer," and showed Lord John Russell attacking Cardinal Wiseman.

Tenniel gradually took over the work of drawing the weekly political cartoon which had hitherto been the work of John Leach, and when the latter died in 1864, Tenniel continued the work alone. From that year until his retirement he missed making his weekly cartoon less than a dozen times. His work for *Punch* which comprised fifty years of service, included 2300 political cartoons and an immense number of drawings and double page cartoons. Tenniel's cartoons in the days of the Civil War in America were received with great bitterness in the North, President Lincoln being made the target for many pointed pictures. After Lincoln's assassination *Punch* sought to make amends for its attacks upon him, and Tenniel drew a cartoon showing Britannia laying a wreath on the

President's deathbed under the caption "Britannia Sympathizes with Columbia." Among other famous men whom Tenniel made the subject of his sketches were Bismarck, Emperor William of Germany, Gladstone, Napoleon III, and Disraeli. Perhaps the best known of his cartoons was "Dropping the Pilot," at the time of the resignation of Prince Bismarck in 1889. It showed the young Kaiser looking over the side of the great ship of State of which he was captain, at the figure of Bismarck, the pilot, descending the ladder. It is said that both the Emperor and Bismarck were pleased by the cartoon, the original of which Tenniel gave to Lord Rosebery who in turn presented it to Bismarck.

Outside of his work for *Punch* the best known of Tenniel's work are his illustrations for Lewis Carroll's *Alice in Wonderland* and *Alice Through the Looking Glass*. These illustrations helped to make a success of these books which in their first editions, illustrated by another hand, found little sale. Other books which he illustrated were *Lalla Rookh* and the *Ingoldsby Legends*. Tenniel was made a knight in 1893 and in 1901, after 50 years' service, he retired from the staff of *Punch*. When a boy Tenniel lost the sight of one eye by an accident, and did his best work under this handicap, becoming in his later years totally blind. He outlived all his contemporaries on the staff of *Punch*, including Thackeray, Mayhew, Mark Lemon, and Du Maurier.

TENNIS. See LAWN TENNIS.

TERRESTRIAL MAGNETISM. See CARNEGIE INSTITUTION.

TETANUS. The twelfth annual summary of Fourth of July injuries compiled by the *Journal of the American Medical Association* shows that only three cases of tetanus were reported in 1914 as against 150 in 1909, since which year the cases have been steadily decreasing. In all three instances the disease was fatal, two of them resulting from blank-cartridge wounds and one from a gunshot wound. Besides these deaths 37 persons were killed by fireworks, making a total of 40 deaths, or 8 more than in 1913. Five were killed outright by firearms, 6 by powder explosions, bombs, or torpedoes, 4 by cannon, and 5 as a result of blood-poisoning. The most serious fact presented in 1914 was that 16 persons, mostly little girls or small children, were burned to death from fireworks, three of these being due to the supposedly harmless "sparklers." The total number of injuries in 1914 was 1506, an increase of 343 over 1913 and of 518 over 1912. New York had 250 casualties, or almost double the number reported in 1913. Illinois had 95, Massachusetts and Connecticut respectively, 87 and 77, the largest total since 1910. Pennsylvania still led the list with 487 casualties, 241 of which occurred in Philadelphia. The results of the accidents vary from total blindness, 3 cases; to loss of one eye, 13 cases; loss of legs, arms, or hands, 16 cases; and the loss of one or more fingers, 67 cases; 402 injuries were due to the giant firecrackers, which continue to hold first place as the cause of lacerated wounds, and were responsible for most of the injuries to the eyes, hands, and fingers. The number of injuries caused by firearms showed a marked increase, 231 cases being reported, including five deaths. As usual the innocent bystander was the victim rather than the reckless user of the weapon. The *Journal* again reiterated its contention that the responsibility rests

with the city governments. The increased number of killed and injured indicated a relaxation in the enforcement of the ordinances so ably undertaken two years before. It was believed instead of a relaxation of restrictive measures, the use of fireworks should be entirely prohibited.

TEXAS. POPULATION. The estimated population on July 1, 1914, was 4,257,854. The population in 1910 was 3,896,542.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

	Acreage	Prod. bu.	Value
Corn ... 1914	6,400,000	124,800,000	\$92,352,000
1913	6,800,000	163,200,000	188,824,000
Wheat ... 1914	1,082,000	14,066,000	13,925,000
1913	780,000	18,650,000	12,831,000
Oats ... 1914	900,000	22,500,000	10,800,000
1913	1,000,000	82,500,000	16,575,000
Barley ... 1914	8,000	200,000	140,000
1913	7,000	168,000	136,000
Rice ... 1914	239,700	8,102,000	7,454,000
1913	808,000	9,696,000	8,339,000
Potatoes 1914	44,000	2,684,000	2,791,000

1913	200	210,000	52,000
Cotton . 1914	11,980,000	4,560,000	148,528,000
1913	12,597,000	8,945,000	217,327,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. Texas ranks nineteenth among the States in the value of its mineral production. In the percentage of its increase in 1913 over 1912, Texas was exceeded only by one other State—Oklahoma. The total value of mineral products increased from \$22,797,015 in 1912 to \$31,666,910 in 1913. The increases were made in the output of all the products, but especially in that of petroleum, which has first place in the mineral products of the State. Texas now ranks fourth among all the States in the quantity of petroleum produced and seventh with respect to the value of this product. The production increased from 11,735,057 barrels, valued at \$8,852,713 in 1912, to 15,099,478 barrels, valued at \$14,675,593, in 1913. Second in importance is coal, including lignite or brown coal, the combined production of which amounted in 1913 to 2,429,144 short tons, valued at \$4,288,920, compared with 2,188,612 short tons, valued at \$3,655,744 in 1912. Texas is the only State in the Union that produces considerable quantities of both bituminous coal and true lignite, or brown coal. The only other mineral products which contribute as much as \$1,000,000 to the total value are asphalt, cement, clay, and natural gas. The manufacture of Portland cement is an industry barely five years old at the end of 1913, but the value of the cement produced in that year was \$2,663,063, an increase of over \$600,000 from the product of 1912. The value of natural gas produced in 1913 showed a substantial increase, amounting to \$2,073,823, compared with \$1,405,077 in 1912. The asphalt produced in Texas, which is principally residue obtained from the heavy asphaltic oils, amounted to 122,028 short tons in 1913, with a value of \$1,970,354. The output of the metal mines of the State in 1914, according to the estimates of the United States Geological Survey, amounted to \$9302 in gold, 581,000 ounces of silver, 190,000 pounds of lead, 30,000 pounds of copper, and 190,000 pounds of

zinc. These figures show a considerable increase for gold and silver, a large decrease for zinc, and smaller decreases for copper and lead. In addition to this a small quantity of natural asphalt was produced. Other mineral products of value are gypsum, salt, limestone, granite, copper, mineral waters, quicksilver, sand and gravel, sulphur, and zinc. Sulphur operations, with methods similar to those employed at Sulphur City, La., were begun at Bryan Heights, in Brazoria County, in 1913.

TRANSPORTATION. The total mileage of railways, including main line, branches, and spurs, in 1913 was 15,283, an increase of 342 miles over the mileage for 1912. The roads having the longest mileage are the Galveston, Harrisburg, and San Antonio, 1331; the Missouri, Kansas, and Texas, 1119; the International and Great Northern, 1106; and the Texas and New Orleans, 1038.

EDUCATION. The latest statistics of education available are for 1912. In that year there were 1,017,033 children of school age in the State, of whom 812,896 were white and 204,337 were colored. The white children included 79,491 Mexicans and 29,345 Germans.

FINANCE. The report of the State Treasurer for the fiscal year 1914 shows a balance in the treasury on Sept. 1, 1913, of \$333,615. The receipts for the year amounted to \$14,274,728, and the disbursements to \$12,886,734, leaving a balance on hand on Sept. 1, 1914, of \$1,721,609. The bonded debt on Sept. 1, 1914, amounted to \$3,977,500.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions controlled by the State include the State Blind Institute, the State Deaf and Dumb Institute, the State Lunatic Asylum, the Southwestern Insane Asylum, at San Antonio; the North Texas Insane Sanitarium at Terrell; the Confederate Home, the Deaf, Dumb, and Blind Institute, and the Confederate Women's Home, at Austin; the Epileptic Colony at Abilene; the State Orphans' Home at Corsicana; the State Industrial School for Boys at Gatesville; and the State Tuberculosis Sanatorium at Carlbad.

POLITICS AND GOVERNMENT. The State Legislature met in two extraordinary sessions, in August, September, and October of 1914, having been called by the Governor for the purpose of taking some action towards remedying the cotton situation, which at that time confronted the people of Texas in a rather unfavorable way. The outcome of these sessions was confined virtually to the enactment of a law creating and organizing a public warehouse system for the storage of cotton under State supervision. The Governor failed in his effort to have the Legislature pass a law prohibiting the planting of a larger cotton acreage than was planted the previous year, and he also failed in his endeavor to have the Legislature create a bank of Texas, to occupy the same relation to the State banks of Texas that the Federal reserve bank bears to the banks of its district. A number of pieces of legislation of minor importance were enacted.

Elections were held for State officers and for Congressmen. In the Democratic primaries held July 25 James E. Ferguson was nominated for Governor, defeating Thomas H. Ball. The two chief issues in the campaign were prohibition and the restriction of land rentals. Mr. Ferguson's principal plank demanded a law to pro-

hibit a charge for the rental of farm land in excess of a fourth of the cotton and a third of the grain raised by the tenant. His opponent, Mr. Ball, agreed with him as to the necessity of giving relief to the tenant, but he did not concur in the Ferguson plan, proposing instead a system of State loans with which to help the tenant farmer to purchase land. At the election of November 3 Mr. Ferguson, the Democratic nominee, was elected Governor, the vote being: Ferguson, Democrat, 175,804; Etheridge, Progressive, 1974; Philp, Republican, 11,411; Meitzen, Socialist, 25,083; Choate, Socialist Labor, 490. At this election there was also submitted an amendment to the constitution providing for the initiative and referendum, which was defeated.

STATE GOVERNMENT, 1914. Governor, Oscar B. Colquitt; Lieutenant-Governor, Will H. Mayes; Secretary of State, F. C. Weinert; Attorney-General, Benjamin F. Looney; State Treasurer, J. M. Edwards; Comptroller, W. P. Lane; Superintendent of Public Instruction, W. F. Doughty; Land Commissioner, J. T. Robinson; Commissioner of Agriculture, Ed. R. Kone—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Thos. J. Brown; Associate Justices, N. Phillips and W. E. Hawkins; Clerk, F. T. Connerly—all Democrats.

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

TEXAS, UNIVERSITY OF. A State institution for higher education, founded at Austin, Texas, in 1883. The total enrollment in all departments of the university in the autumn of 1914 was 2441, divided as follows: College of Arts, 1468; Graduate Department, 75; Law Department, 343; Medical Departments, 280; Engineering Department, 275; Education Department, 421. There were 191 members in the faculty. During the year a School of Journalism opened with William H. Mayes at its head. J. M. Bryant, of the University of Illinois, succeeded N. H. Brown, resigned, as professor of electrical engineering. Forrest E. Cardullo became head of a new department of mechanical engineering. Dr. James F. Royster, of the University of North Carolina, was appointed professor of English, and Dr. A. B. Wolfe, of Oberlin College, was appointed professor of sociology and economics. S. E. Mezes, president of the university, resigned, to become president of the College of the City of New York. There was a gift of \$25,000 given to the university by Regent George W. Littlefield, to establish the Littlefield Fund for Southern History. The institution is supported mainly by State appropriations. The productive funds amount to \$2,050,000, and the annual income from this endowment amounts to \$165,000. The library contains about 110,000 bound volumes and 30,000 pamphlets.

TEXAS FEVER. See VETERINARY MEDICINE.

TEXTILE MANUFACTURING. Many abnormal conditions prevailed in the textile industries in 1914, not the least of which naturally was the great European War, with the various complications it presented. In the

United States financial depression had its effect, and the extraordinary conditions surrounding cotton and wool were also responsible for much unrest and lack of confidence and harmony in the different industries. With the outbreak of the war a number of European purchasing representatives were in the market for cloth, and cloth for uniforms, shirtings, etc., was readily and speedily manufactured by a large number of American plants. At the same time this did not compensate for the quietness of the domestic business. In many lines consumers were buying only what their immediate needs demanded. The embargo on wool, which was declared as a war measure and which prevented shipments of wool and other products from British to non-British ports, was most disturbing, especially as the American clip supplies normally only about 37 per cent of the wool used in the United States. The war also cut off from the United States the supply of wool from Turkey, Russia, and elsewhere in Europe. Cotton (q.v.) likewise had an erratic course during the year, with low prices and little domestic demand.

The record of new mill construction in the United States for 1914 as compiled by the *Textile World Record* of Boston showed 245 new mills, as compared with the annual average of 260 new mills for the nine preceding years. This record was surprisingly good in view of general business conditions during the year and it was interesting to note that the cotton, wool, and silk branches of the industry showed but slight decreases in the number of new establishments as compared with 1913. The knitting industry reported 110 new mills as compared with 142 in the previous year, while miscellaneous mills increased from 30 in 1913 to 37 in 1914. These items are shown in the accompanying table.

COMPARISON OF NEW MILL CONSTRUCTION FOR FIVE YEARS

	1914	1913	1912	1911	1910
Cotton	26	27	87	82	67
Wool	21	24	24	20	81
Knitting	110	142	122	92	118
Silk	51	54	46	38	84
Miscellaneous	87	80	86	26	29
	245	277	265	208	274

The distribution of the cotton manufacturing industry is always a matter of interest. In 1913, 75 per cent of the new spindles in cotton mills were reported from the Southern States and only 25 per cent from the North, whereas in 1914 the northern section of the country claimed 44 per cent of the new cotton spindles. North Carolina led all other States in number of new mills, viz., seven, equipped with 93,700 spindles and 1700 looms. The new Naumkeag Mill at Salem, Mass., to take the place of a structure destroyed in the conflagration at that city, was the largest under construction during the year, with 100,000 spindles and 3000 looms. The accompanying tables show the statistics by States.

COMPARISON OF SPINDLES IN NEW COTTON MILLS FOR THE FIVE YEARS, 1910-1914

	1914	1913	1912	1911	1910

Total	10	Total	1
		Grand total	21

During the year 21 new woolen and worsted mills were built, as compared with 24 in 1913. Of these nine were in Pennsylvania, the others being located in eight other States, of which Massachusetts and Rhode Island each had three. Eleven of the 21 were worsted weaving and spinning mills, 7 were woolen yarn or cloth mills, and 3 were carpet mills. The larger organizations like the Cleveland Worsted Mills Company and the American Woollen Company made important additions to their plants during the year. The total 21 new mills compared with 24 for 1913; 23 for 1912; 17 for 1911; and 31 for 1910.

The new knitting mills exhibited a decided tendency toward concentration, 70 per cent of the total being located in the Middle States and 44 per cent of the total in Pennsylvania. New knitting mills in the South decreased from 24 in 1913 to 18 in 1914, while the Western States showed a shrinkage from 25 last year to 9 this year. Thirty-two of the new knitting mills manufacture sweaters and other outer garments, showing the continued demand and it was said that much of this product was desired by the contesting nations in Europe.

The tendency towards concentration was still manifested by the location of mills in New Jersey and Pennsylvania. See **SILK**.

THEATRE. See **ARCHITECTURE**; **DRAMA**.

THEOLOGICAL SCHOOLS. See **UNIVERSITIES AND COLLEGES**.

THERMIONS. See **PHYSICS**.

THOMAS, BRANDON. An English playwright and actor, died June 19, 1914. He was born in Liverpool in 1856, and was educated at private schools to become a civil engineer, having previously had some experience in the navy and being interested in shipbuilding. His adoption of the stage was the result of his success as an entertainer in amateur performances. He was for several years an actor, but soon retired to become an author, his first successful play being *Comrades*, written in 1882. This was followed by several others which had no great vogue, but in 1892 he wrote *Charley's Aunt*, which was produced in the same year with W. S. Penley in the leading rôle, and became the most successful farce ever written in the English language. It was acted by Penley four years, was translated into every European language, and had a great success in the United States. It is perennially revived in London. *Marriage* was produced in the same year and was also successful. Other plays written by him are: *Women Are So Serious* (1901); *Fourchette & Co.* (1904); *A Judge's Memory* (1906). Thomas appeared in the United States in a minor part as a member of the company supporting Rosina Vokes.

THOMSON, JAMES WILLIAM. Rear admiral (retired) of the United States navy, died March 17, 1914. He was born in Wilmington, Del., in 1836, and received an academic education. In 1856 he was appointed third assistant engineer of the United States navy, and became first assistant engineer in 1859 and chief engineer in 1862. He served throughout the Civil War and took part also in the Spanish-American War, being retired from active service in 1896. In 1906 he was advanced to the rank of rear admiral in recognition of his services during the

Civil War. At various times he was a member of the board of the Naval Academy, of the board of inspection, of the board of examiners, and examining board of the navy.

TIBET. A central Asian dependency of China, with an estimated area of 756,000 square miles carrying a population of 2,000,000. Lhasa is the capital, with between 15,000 and 20,000 inhabitants, among whom are included many Buddhist monks, the city being the home of Buddhism. A primitive agriculture is practiced, and gold is said to exist. Trade is largely with China and India. The Dalai Lama, restored to his office in 1912 by the Chinese government, resides at Lhasa.

TICK, CATTLE. See **VETERINARY MEDICINE.**

TIEGHEM, VAN PHILIPPE. A French botanist, died April 29, 1914. He was born at Bailleul in the department of the Nord in 1839, and was educated at a normal high school, graduating in 1858. He was perpetual secretary of the Academy of Sciences, one of the five academies that go to make up the French Institute, was also a professor at the Museum of Natural History, and was long an officer of the Legion of Honor. Among his many writings on botanical subjects was a treatise on botany in two volumes and *Elements of Botany*, two volumes. He was editor of the botanical section of the *Annales des Sciences Naturelles*, in which much of his most distinguished work of recent years appeared.

TIMBER SURVEY, NATIONAL. See **FORESTRY.**

TIME, STANDARD. On May 1, 1914, the city of Cleveland, Ohio, passed an ordinance, making Eastern Time instead of Central Time the legal standard for that city, and efforts were being made by the city to induce the railways going into it to use Eastern instead of Central Time. Other Ohio cities were agitating for similar action, and it was proposed that the whole State should adopt Eastern Time at its standard. This action was one threatening more than local consequences, for its extension would mean the disorganization and consequent revision of the whole system of Standard Time throughout the United States, which has been in vogue since 1883. Cleveland is situated about midway between the meridians of 75° and 90° West of Greenwich, on which Eastern and Central Time respectively are correct, and consequently there would be a difference of half an hour between the true astronomical time for Cleveland and that of either meridian. This is one of the first attempts to accomplish a change of hours in the ordinary economy of a community, by changing time standards, although it had been attempted in England under the guise of the famous Daylight Saving Bill.

TIME SIGNALS. See **WIRELESS TELEGRAPHY AND TELEPHONE.**

TIN. There is practically no production of tin in the United States. There was obtained in 1913, an equivalent of only 84 short tons of tin ore, containing 60 per cent of metallic tin, valued at \$36,970, the larger part of which was taken from Buck Creek, Alaska. Smaller quantities were taken in other parts of Alaska, South Dakota, and South Carolina. The Federated Malay States produced by far the greatest quantity of tin. During 1913 the shipments amounted to 56,142 short tons, against 54,231 tons in 1912. Considerable quantities were also

produced from Bolivia. The world's tin deliveries in 1913 amounted to 130,009 short tons. See **CHEMISTRY, INDUSTRIAL.**

TIRPITZ, ALFRED P. F. VON. See **WAR OF THE NATIONS.**

TOBACCO. The tobacco crop of the United States in 1914, according to the preliminary estimates of the United States Department of Agriculture, was 982,715,000 pounds, as compared with 953,734,000 pounds in 1913, and a five-year average of 996,087,000 pounds. The production in the leading States was as follows: Massachusetts 11,555,000 pounds; Connecticut 35,754,000; Pennsylvania 47,995,000; New York, 5,980,000; Maryland 16,000,000; Virginia 104,000,000; West Virginia 8,856,000; North Carolina 146,250,000; South Carolina 33,580,000; Ohio 78,120,000; Indiana 12,150,000; Wisconsin 53,808,000; Kentucky 353,535,000; and Tennessee 63,468,000 pounds.

The total area of cigar tobacco was 172,900 acres, compared with 168,000 in 1913, an increase of 4900 acres. Pennsylvania was the only State showing a decrease. All the other principal States had a larger area. The chewing, smoking, snuff, and export types were grown on 967,600 acres, against 1,036,300 acres in 1913, a decrease of 68,700 acres. The total area in tobacco was 1,151,000 acres, 5.4 per cent less than in 1913.

The preliminary report of the United States Commissioner of Internal Revenue shows that tax was paid upon 8,707,626,230 cigars, 16,427,086,016 cigarettes, 32,766,741 pounds of snuff, and 412,505,213 pounds of chewing and smoking tobacco. Little cigars increased over 3,000,000 in number and manufactured tobacco (smoking, chewing, and snuff) over 8,000,000 pounds as compared with 1913, while the number of large cigars decreased by 28,000,000. The internal revenue receipts for the fiscal year were \$79,986,639.68, or more than in 1913 by \$3,197,214.93. The tax measure due to the European War imposed additional revenue taxes on tobacco manufacture and sale.

A bulletin incorporating the general results of nearly 20 years' experimental work on tobacco growing and handling was issued by the Connecticut Experiment Station (E. H. Jenkins, "Studies on the Tobacco Crop of Connecticut," *Connecticut State Experiment Station Bulletin* 180).

The British Colonial Office has secured the services of an American tobacco expert to develop the tobacco industry of Ceylon and improve the quality of the product. Excellent crops are already produced in the Jaffna district but the product is suited only for native use. American varieties are being tested. Uruguay has authorized a monopoly of the tobacco industry, granting for 25 years the sole right to manufacture and sell tobacco in that country. The monopoly is given the right to purchase all tobacco factories in the republic at a fair assessed value, or to take them into the combine as shareholders. The payment to the government is to be graduated, amounting to over \$2,000,000 annually after the twelfth year. It is thought the plan will assure a larger return to the government than the former system of taxation. The estimated annual consumption of tobacco in Uruguay is 7,150,000 pounds. See **CANCER.**

TOGO. A German West African protectorate

lying between Dohomey and the Gold Coast. Estimated area, 87,200 square kilometers (33,668 square miles); estimated native population, 1,032,000. Whites numbered, Jan. 1, 1913, 368. The export of cotton in 1912 was 550,896 kilos; of cacao, 282,982. The imports and exports for 1911 were valued at 9,620,000 and 9,318,000 marks respectively. Imports and exports in 1912 were valued at 11,428,000 and 9,959,000 marks respectively; in 1913, 10,631,000 and 9,138,000. Of the exports in 1912, palm kernels were valued at 3,380,000 marks; palm oil, 1,413,000; rubber, 976,000. Vessels entered in the 1912 trade, 258, of 5,721,832 tons. A railway connects Lome with Anecho in Little Popo, 44 kilometers; with branches from Lome to Polime, 119 kilometers, and Atakpame, 160 kilometers. For 1913-14 the budget balanced at 4,057,136 marks. Lome is the capital and chief port. Duke Adolf Friedrich of Mecklenburg-Schwerin was Governor in 1914.

On August 8, shortly after the outbreak of war between Great Britain and Germany, British warships captured Port Lome on the coast of Togo. After a skirmish between the British and the German forces on August 18, the colony was surrendered on August 25. Consult the article on the WAR OF THE NATIONS.

TOMBO, RUDOLF, JR. American scholar and educator, died May 22, 1914. He was born at Harmen, Germany, in 1875, and removed to the United States with his parents when he was still a child. He graduated from the College of the City of New York in 1895 and after two years in business entered Columbia for a graduate course, receiving in 1893 the degree of master of arts, in 1899 master of science, and in 1901 doctor of philosophy. He became a tutor at Columbia in 1900, and rose through various steps to the post of associate professor of Germanic languages in 1911. In 1902, immediately after the election of Nicholas Murray Butler as president of Columbia, Dr. Tombo was appointed registrar of the university, holding this position until 1908, when he became secretary of the alumni council. He resigned the secretaryship in 1911 to become director of the Deutsches Haus at Columbia, which is the centre of Germanistic learning in New York City. He organized the alumni of Columbia University, and by means of his efforts the alumni council of the university became one of the most progressive college alumni organizations in the United States. At the time of his death Dr. Tombo was secretary of the Germanistic Society and was also editor of the *Germanistic Society Quarterly*. For twelve years he was editor and business manager of the *Columbia University Quarterly*.

TONGKING. The northernmost division of the colony of French Indo-China (q.v.). The capital, Hanoi, with 103,238 inhabitants, is also the capital of French Indo-China.

TORNEY, HENRY. An American surgeon, died in Washington, D. C., Dec. 27, 1913. He was born June 1, 1850, and graduated in medicine at the University of Virginia in 1870. He entered the United States navy as assistant surgeon in 1871, became passed assistant surgeon (1874), and in the following year resigned from the navy and was appointed first lieutenant and assistant surgeon, United States army. He was made captain and assistant surgeon in 1880; major and surgeon in 1894; lieutenant-colonel

in 1903; and colonel, medical corps, in 1908. His period of service was brilliant and highly useful, especially on the administrative side. He was at West Point (1894-98), and in May-October of the latter year had charge of the United States army hospital ship *Relief*, serving in Cuba, Porto Rico, and the United States. After the close of the Spanish-American War he was for a short time instructor in hygiene at the Army School, Fort Leavenworth; and later was at the head of the Army and Navy General Hospital, Hot Springs, Ark. (1899-1902). He was in command of the First Reserve Hospital, Manila, P. I. (1902-03); after his return he was appointed chief surgeon of the Department of California (1903); and later was in charge of the General Hospital, Presidio, Cal. (1904-08). At the time of the San Francisco earthquake and fire he directed the sanitary work, and proved to be a highly capable administrative officer. On Jan. 14, 1909, he was appointed surgeon-general of the United States army, and removed to Washington. He was a fellow of the American Medical Association; president of the Association of Military Surgeons of the United States at its Milwaukee meeting (1911); and chairman of the War Relief Committee of the American National Red Cross.

TORONTO, UNIVERSITY OF. An institution for higher education, founded in 1827 as Kings' College, at Toronto, Canada. The enrollment in the several departments of the university in the autumn of 1914 was 4000, including about 250 summer session students, and the faculty numbered 453. During the year the dean of the faculty of applied science died, and Dr. Ellis was appointed acting dean. Doctors Reeve, McDonagh, and Ernest Jones resigned from the faculty of medicine, Dr. McCurdy retired from the faculty of arts, and Dr. H. T. J. Coleman and Mr. W. E. McPherson resigned from the faculty of education. Dr. Peter Sandiford was appointed to succeed Dr. Coleman in the faculty of education. The income of the university for 1913-14 was \$856,726 and the expenditures amounted to \$942,839. The difference was supplied by a special legislative grant. There were 138,658 bound volumes and 46,648 pamphlets in the library.

TORPEDOES. See NAVAL PROGRESS; SUBMARINES.

TOWNSEND, STEPHEN. An English surgeon and author, died May 20, 1914. In early life he was for a time on the stage under the name of Will Dennis, when he appeared in several well-known plays. In 1889 he married Frances Hodgson Burnett, the American novelist. He was well-known as a lecturer and examiner on medical subjects. His published writings include: *Dr. Tuppy*; *A Thoroughbred Mongrel*; *A Leaf from a Hospital Daybook*; and *Peep Show Vivisection*.

TOWN PLANNING. See CITY PLANNING.

TRADE COMMISSION BILL. See UNITED STATES, section Congress.

TRADE UNIONS. The progress of the movement of organization among laborers continued in 1914 without any notable variations from the normal course. There were fewer manifestations of the extreme radicalism attending the Syndicalist propaganda at home and abroad (see SYNDICALISM), and the Industrial Workers of the World (q.v.) in the United States. The

movement toward industrial unionism, however, was clearly making advance in the United States, England, and Germany, as indicated in the paragraphs following and in the article *LABOR, AMERICAN FEDERATION OF*. The labor wars of the year were numerous and in some cases prolonged and bitter. They are treated under *STRIKES*. The agitation of trade-unionists in the United States for a modification of the rules governing the issue of injunctions and for the exemption of labor organizations from the anti-trust law culminated in sections of the Clayton Anti-Trust Act as described hereunder. See also *INJUNCTION*; and *BOYCOTT*.

LEGISLATION. There was very little legislation bearing directly on trade unions enacted in 1914. The most important was contained in those sections of the Clayton Anti-Trust Act noted below. New laws of interest to trade unions are referred to under *ARBITRATION AND CONCILIATION*, *INDUSTRIAL*; *INJUNCTION*; and *LABOR LEGISLATION*.

Louisiana made it unlawful to coerce, require, or influence an employee to enter into any contract, actual or implied, not to become or remain a member of any labor organization as a condition of securing or retaining employment. Massachusetts provided that persons seeking employment may not be prosecuted for entering into any agreement or combination for the purpose of shortening hours, increasing wages, or bettering working conditions, or for any act, not in itself unlawful, done in furtherance of these purposes.

Clayton Bill. The most important bit of labor legislation of the year was comprised in certain sections of the Clayton Anti-Trust Act whereby labor organizations and other nonprofit-making associations were exempted from the anti-trust laws. This exemption had been striven for by the American Federation of Labor for several years; agitation for it had been especially vigorous on account of the fining of the Hatters' Union in the famous Danbury Hatters' Boycott case. (See *BOYCOTT*.) In 1913 and again in 1914 the appropriation of \$300,000 to the Department of Justice for the enforcement of anti-trust laws was accompanied by a proviso that no part of that money should be spent in prosecuting any person or persons combining to increase wages, shorten hours, or otherwise better the conditions of labor.

The Clayton Act signed October 15 went much farther, section 6 containing the following provision: "That the labor of a human being is not a commodity or article of commerce. Nothing contained in the anti-trust laws shall be construed to forbid the existence and operation of labor, agricultural or horticultural organizations, instituted for the purposes of mutual help, and not having capital stock or conducted for profit, or to forbid or restrain individual members of such organizations from lawfully carrying out the legitimate objects thereof; nor shall such organizations, or the members thereof, be held or construed to be illegal combinations or conspiracies in restraint of trade under the anti-trust laws." The first sentence of this section was declared by President Samuel Gompers "the industrial Magna Charta upon which the working people will rear their structure of industrial freedom." The *New York World* considered this section "the most impressive legislative reversal of judicial decisions that has

taken place in this country since the Dred Scott judgment was overturned by the Civil War." President Wilson declared it, though very important, "the natural and inevitable corollary of a law whose object is individual freedom and initiative as against any kind of private domination."

Injunctions in Trade Disputes. For several years the American Federation of Labor led a vigorous agitation in favor of limiting the power of the courts in the issue of injunctions. This agitation culminated in sections 20-25 inclusive of the Clayton Anti-Trust Act, signed October 15. Vigorous demand for a limitation of the power of the courts in the issue of injunctions grew out of the long-continued legal controversy resulting from the boycott of the American Federation of Labor against the Buck's Stove and Range Company, and especially resulting from the injunction issued by Justice Wright of the Supreme Court of the District of Columbia. (See *BOYCOTT* and *INJUNCTION*.) This demand culminated in sections 20-25 inclusive of the Clayton Anti-Trust Act. These sections declared that no restraining order or injunction may be granted by any United States court in labor disputes regarding the terms or conditions of employment, unless such order be necessary to prevent irreparable injury to property or to property rights, for which injury no adequate remedy at law exists. Moreover no injunction may prohibit any person or persons, singly or in concert, from stopping work; peacefully persuading others to work or to stop work; from attending any place where they may lawfully be for the purpose of obtaining or giving information or peacefully persuading others; from ceasing to patronize or to employ any party to such dispute, or peacefully persuading others to do so; from giving or withholding strike benefits or other things of value; or peacefully assembling in a lawful manner and for lawful purposes; or from doing anything which may lawfully be done in the absence of such dispute. Moreover none of these acts may be considered violations of any law of the United States.

All the foregoing limitations were contained in section 20. Subsequent sections dealt with the treatment of persons accused of violating injunctions. Labor leaders, especially when the principal officers of the American Federation of Labor were sentenced to fines and imprisonment, contended that punishment for such violations ought not to be at the discretion of the judge issuing the order. The Clayton Anti-Trust Act provides that any person willfully disobeying any order by a United States court provided the act thus committed should be of such character as to constitute also a criminal offense under Federal or State law shall have a right of trial by jury. Persons accused of violating an injunction may be ordered by the court to show cause why they should not be punished therefor. If the court be not sufficiently satisfied of the innocence of the accused, trial may be had by the court, unless the accused demand trial by jury. If found guilty judgment may be entered at the discretion of the court. Contempts committed in the presence of the court are exempted from this privilege.

DYNAMITE CASES. The notorious criminal suits against officers and members of the Structural Bridge and Iron Workers' Union as the

result of numerous conspiracies to transport dynamite and use it in the destruction of life and property were further advanced. There were originally 40 defendants of whom 38 were found guilty in the United States District Court at Indianapolis, December, 1912. All but five of these were sentenced to imprisonment at the Leavenworth penitentiary. Thereafter 30 of these appealed their cases. On January 6 the United States Circuit Court of Appeals at Chicago affirmed the sentences imposed by the lower court on 24 of them, but remanded the remaining six to the lower court for retrial. Attorneys for the 24 then applied for a rehearing.

GREAT BRITAIN. During the past few years the trade union movement in Great Britain has been marked by a tendency toward the formation of industrial unions, a wide extension of the demand for an eight-hour day and the increased insistence on the establishment of higher minimum wages. Thus on April 23 there was held in London a conference by the 57 delegates representing the Miners Federation, the Transport Workers Federation, and the National Union of Railway Men. These three organizations with respectively 800,000, 250,000, and 300,000 members are large industrial unions, the last two formed in recent years. A resolution was adopted calling for a working agreement between the three bodies. On May 26 a special committee from these organizations took further steps toward formulating a working agreement. In the building trades also was observable a movement toward larger federation on industrial lines.

The demand for the establishment of considerable minimum wages was illustrated by a movement undertaken by the National Union of Railway Men and the Associated Society of Locomotive Engineers and Firemen for an all-round increase of \$1.25 for men of all grades. This was accompanied by a demand that in the poorly paid grades a minimum of \$7.50 per week should be established. The Scottish miners put forward a demand for a standard daily wage of \$1.75 for all coal getters; the extension of the eight-hour law to surface workers, a minimum wage of \$1.25 for surface workers, exclusion of non-unionists from mines, and stricter enforcement of safety regulations under ground. The coal miners of South Yorkshire who engaged in a great fight for a minimum wage in 1912 and 1913 set up a demand for an increase in this minimum. Sir Edward Clark, the arbitrator, had fixed the minimum in 1912 at \$1.66 per day. Advances in 1913, granted by the conciliation board, raised the minimum to \$1.82 per day; but Sir Edward Clark's second award, in January, 1914, fixed the minimum at \$1.78 per day. The mine operators contended that the latter should constitute the minimum, whereas the miners held that the 16-cent advance of 1913 should be added to this, making a minimum of \$1.92 per day. Brewery workers in London demanded a minimum of \$3.75 per week for women employees and \$7.50 per week for adult men.

The general report of the British Friendly Societies showed that 680 trade unions were registered under the insurance scheme; they constituted a majority of the unions. These unions had a total of 2,597,772 members, an increase of more than 1,000,000 in 10 years. A large portion of this increase was due to the Social Insurance Act (see SOCIAL INSURANCE, *Great Brit-*

ain). Thirteen of the unions showed reserve funds of more than \$500,000 each. Thus the Amalgamated Society of Engineers had total resources of \$3,931,000; the Cotton Spinners, \$2,503,000; Railway Servants, \$1,895,000; Derbyshire miners, \$1,220,000; Boiler-Makers, \$1,113,000; Locomotive Engineers, \$848,000; Yorkshire miners, \$816,000; Durham miners, \$796,000; the Boot and Shoe Operatives, \$774,000.

GERMANY. The trade unions of Germany fall into three groups: the General Commission of Trade Unions, Christian Unions, and the Hirsch-Duncker Unions. At the beginning of 1914 the General Commission included 47 general unions with a total average membership of 2,548,763. This was an increase of 716,093 as compared with 1909. The number of unions has decreased, owing to amalgamation among kindred trades. The membership was distributed among the following trades: building, 436,061; metal, 580,093; textile, 138,079; transport, 254,236; mining, 101,908; clothing, 112,459; woodworking, 209,703; food, drink, and tobacco, 118,341; clay, glass, and stone, 75,907; paper, and leather, 74,877; printing, 102,246; other trades, 297,974. Female trade union members numbered 223,676 in 29 of the affiliated unions. The largest female membership was found in the textile workers, 54,846; metal workers, 27,971; and general factory workers, 26,376.

The total income of the 47 national unions in 1913 was \$19,525,000, total expenditures were \$17,835,000, and funds on hand, \$20,969,000. Of the expenditures, \$11,379,000 were for benefits; \$800,000 for educational purposes; \$2,420,000 for organizing and related expenses; and \$3,235,000 for management. The principal items among benefits were the following: strike, lockout, and victimization benefits, \$4,177,000; traveling and unemployment, \$3,105,000; sick, \$3,217,000.

The largest single union comprised in the General Commission includes the Metal Workers, which is the largest trade union in Europe. Its total membership, Jan. 1, 1914, was 544,934, a decrease of 16,613 during the year. This decrease was due to unsuccessful labor disputes, especially among the shipbuilders. During the year 1913 this union paid benefits amounting to \$3,364,597. The largest items of benefits were for strike pay, loss of work through sickness, and loss of work through unemployment, these three items being somewhat equal and including 90 per cent of the total. Funds on hand at the end of 1913 were \$4,416,000. Benefits were also paid for traveling and removal, funerals, legal protection, and relief in cases of need. Similar benefits are paid by the other large unions noted above.

The Hirsch-Duncker Unions comprised 106,618 members at the close of 1913. Their total income was \$682,000; and expenditures in various benefits, \$624,000. Funds at the close of the year amounted to \$411,000.

The Christian Trade Unions comprised 324,785 members at the close of 1913. Their total income for the year was \$1,709,000; and funds on hand, \$2,305,000.

The ninth German Trade Union Congress was held in Munich, June 22-27, 1914. Delegates numbering 458 were present, including those from the Coöperative Federation of Germany, the Social Democratic party, and trade unions of Austria, Great Britain, Switzerland, and Scandinavian countries. This Congress includes the

General Commission of Trade Unions above noted. In addition to the above statistics it was reported that the trade union and coöperative insurance company, "Volksfürsorge," had issued 74,746 insurance policies in the first months of its existence, July 7 to Dec. 31, 1913, representing \$3,154,000 insurance. Much attention was given to the methods of settlement of jurisdictional disputes. It was agreed to render mutual assistance in strikes and lockouts. After any union, engaged in a trade dispute, has levied extra contributions upon itself it may appeal to the general committee of all the affiliated unions. This committee is authorized, then, to exact from all the unions of the General Commission, contributions for the particular union involved. Other subjects dealt with were: the organization of women workers; the insurance society above referred to; the legal protection of strike breakers; collective agreements; rising prices and their effect upon the standard of living; unemployment.

Collective Agreements. According to a report of the Imperial Statistical Office at Berlin there were in existence 10,739 collective trade agreements, affecting 159,930 establishments, with 1,574,000 employees, in Germany, at the close of 1912. Agreements were found in greatest number in the building trades, 2466; food and provisions, 1267; metal working, 1291; and wood working, 1264; large numbers were found also in stone and clay working, textiles, leather, clothing, cleaning, printing, commercial pursuits, traffic, restaurants, and public houses. The building trades comprised 37.9 per cent of all workers under trade agreements; metal working, 12.6 per cent; woodworking, 10 per cent; and clothing, food, and provisions, slightly smaller percentages. A considerable majority of the workers affected by these trade agreements belonged to trade unions. In all but three of them the agreements were made by the associated workers, rather than by individual workers. On the other hand, employers made agreements for the most part individually, but those trade agreements made by employers' associations comprised the majority of all workers affected.

TRANSMISSION OF ELECTRIC POWER. See ELECTRIC POWER, TRANSMISSION OF.

TRANSVAAL. One of the four original provinces of the Union of South Africa. Of the total population in 1911 (1,686,212), 971,555 were males and 714,657 were females. Europeans numbered 420,562, natives, 1,219,845, other colored races, 45,805. The provincial capital is Pretoria, which is also the capital of the union. It had 29,618 inhabitants in 1911. Johannesburg, the largest town and the centre of the Witwatersrand gold hills, had 119,953 white, and 117,151 colored inhabitants in 1911. The total number of schools in 1911 was 711, with an enrollment of 59,112, and an average attendance of 52,577. There were 14,741 pupils in 251 native schools.

Agriculture and grazing are extensively carried on. There were, in 1911, in the province, 1,339,298 cattle, 89,160 horses, 3,415,250 sheep, 1,771,720 goats, 302,882 swine, 25,275 mules, 106,048 asses, 5441 ostriches. The wheat output for 1911 was 3,310,613 muids (of 200 pounds); tobacco, 7,701,774 pounds; potatoes, 411,150 muids (150 pounds); barley, 12,381 muids (160 pounds); oats, 155,067 muids (150 pounds). J. Rissik was Provincial Administra-

tor in 1914. See SOUTH AFRICA, UNION OF, for area, population, and other statistical details.

TRANSYLVANIA. See SHIPBUILDING.

TREATIES. See INTERNATIONAL ARBITRATION AND PEACE, section *Bryan-Wilson Treaties and passim*.

TREITSCHKE. See LITERATURE, ENGLISH AND AMERICAN, *War Literature*.

TRENGGANU. A British possession on the eastern side of the Malay Peninsula, north of Pahang; a native State under British protection. Estimated area, 6000 square miles. The population, census of March, 1911, included 149,379 Malays, 4169 Chinese, 10 whites, 61 Indians, 454 of other races—a total of 154,073. The capital and chief town is Kuala Trengganu, with 13,991 inhabitants. The value of the imports from Singapore, in 1912, was S.S.\$1,053,911; of which rice, S.S.\$651,000; cotton piece goods, S.S.\$153,710; opium, S.S.\$46,160; sugar, S.S.\$41,554. Exports to Singapore, S.S.\$1,513,941; of which dried and salted fish, S.S.\$571,718; tin ore, S.S.\$485,201; paddy, S.S.\$198,285; copra, S.S.\$240,388; black pepper, S.S.\$160,351; wolfram ore, S.S.\$53,384. The reigning Sultan is Sir Zainal Abidin ibni Almerhum Ahmad. The British Agent in 1914 was W. D. Scott (E. A. Dickson, acting).

TRICHINOSIS. See VETERINARY MEDICINE.

TRINIDAD AND TOBAGO. Two islands of the West Indies which together form a British colony. Area of Trinidad, 1754 square miles; of Tobago, 114 square miles. Total population, in 1911, 333,552. Coolie immigration from India is under government control. Number introduced, in 1912-13, 2370. About 445,703 acres are under cultivation. The soil is fertile, and produced for export, in 1912, 663,305 hundredweights of sugar, 370,765 hundredweights of cacao, and 16,305,108 coconuts. Other exports are molasses, rum, bitters, timber, manjack, and asphalt. The mineral wealth is considerable. There is a railway from Port of Spain, the capital, to Arima, 16 miles. The Couva line covers 24 miles; the extension to Claxton's Bay is 4½ miles; that to San Fernando, 7 miles; that to Prince's Town and Sangre Grande, 12 miles; and to Tabaquite, 15 miles. The imports for 1912 were valued at £4,682,325, and the exports at £4,472,577. Customs receipts, 1912, £444,706. Revenue, 1912-13, £932,513; expenditure, £947,221. Tonnage entered and cleared, 3,526,354, of which 2,327,076 tons British. The debt stood, March 31, 1912, at £1,045,092. Governor and commander-in-chief, 1914, Sir George Ruthven Le Hunte.

TRINITY COLLEGE. An institution for higher education, founded in 1863 at Hartford, Conn. There were in the college in the autumn of 1914, 248 students and the faculty numbered 27. There were no notable changes in the faculty during the year. The library and administration building, gift of J. P. Morgan, was completed. The productive funds of the college amounted at the end of the collegiate year 1913-14 to \$1,224,558, and the income was \$80,575. The library contains 71,990 books and 46,699 pamphlets. The president is F. L. Luther, LL.D.

TRIPOLI. A country in Africa bordering on the Mediterranean, between Tunis and Algeria on the west and Egypt on the east; the Sahara lies to the southeast and south. As a result of the Turco-Italian War, Tripoli, hitherto a vil-

yet of the Ottoman Empire, was proclaimed, together with Cyrenaica, a province of the kingdom of Italy. Together, under the name Libya, they cover an area estimated at 405,800 square miles, with about 1,000,000 inhabitants. Tripoli, with 50,000 inhabitants, is the capital of Tripoli; Benghazi, with 30,000 inhabitants, of Cyrenaica (or Benghazi, or Barca)—both Mediterranean ports. There is a Governor for each of the two divisions.

HISTORY. After the victory of Dec. 24, 1913, when the Italian forces at Maharuga and Gurda defeated a body of some 2000 Arab riflemen and killed their leader, Mahomed Ben Abdullah, the Italian military operations were vigorously pushed forward for the pacification of Libya. On February 28, General Ameglio carried a fortified camp of the Arabs at Shleidema (south of Bengasi), killing over 200 natives. On March 3, Colonel Miani occupied Murzuk, the capital of the Fezzan. At Zuetina, near Ghedabia, a sharp engagement was fought, in which over 300 were killed; the effect of the battle was to weaken very much the resistance of the Mogarba Senussi, who controlled Zuetina and Ghedabia, the two important caravan centres in Southern Cyrenaica. Rumors of peace negotiations between the Senussi tribesmen and Italy took root in the visit of Sheikh Idris El Senussi to Alexandria, ostensibly en route for Medina. As Idris was the cousin of the head of the Senussi sect, Grand Sheikh el Senussi, it was believed that he was endeavoring to effect an arrangement whereby the Grand Sheikh would become the Sultan's religious representative in Tripoli and obtain recognition from Italy as an almost independent tributary prince. Later, when the war broke out in Europe, reports were persistently circulated to the effect that German emissaries, and then that Turks, were stirring up the Senussi to wage a holy war against Italy. The truth as to the condition of Libya at the close of the year was not easy to ascertain from conflicting dispatches, but at least one fact was certain, that the Italian government had given proof of its apprehensions by sending large reinforcements to the garrison in Libya.

TROPICAL DISEASES. Infant mortality in the Philippine Islands presented certain anomalous features which were calculated to overturn the preconceived ideas of those accustomed to conditions in the United States or Europe. Infant mortality is greater in Manila than in any city in which records are kept. Faulty nutrition is one of the most prominent of many factors contributing to this high mortality. In temperate countries the death rate of infants fed on cow's milk is from 5 to 10 times as great as among those fed on mother's milk, but in the Philippines the contrary is the case, the mortality there among breast-fed children being higher than among children artificially nourished. The ultimate explanation seems to lie in the deficient quantity and quality of the mother's milk, the women being under nourished, either as a result of faulty diet or the ravages of diseases. To add to the difficulty, at present, clean, fresh, raw cow's milk is not obtainable in any considerable quantity in the Philippine Islands, and the prospect for producing it seems remote. The milk now used is obtained from carabaos and goats, and most of it is dangerous to health, no matter how used. The great problem with respect to infant feeding is the introduction of suitable sub-

stitutes for fresh milk, which must be inexpensive.

Industrial sanitation in the tropics has been stimulated by the demonstration of it during the building of the Panama Canal. That private enterprises can obtain equally favorable results is shown by the experience of the United Fruit Company. The reports of its medical department, which supervises plantations in Panama, Cuba, Central and South America, and cares for over 65,000 employees, shows some remarkable results. In the Panama division, for 1912, the death rate for the white employees was 12 per thousand; that of the black, 11.36 per thousand. In 1913 the white mortality was 3.33; the colored 7.7. This extremely low mortality rate was not obtained in the other divisions of the company's plantations, but the health of the employees has been kept at a high average. The result has been obtained by perfect sanitary organization, building suitable houses and hospitals, drainage, mosquito elimination, and periodic visits to all the plantations by physicians. The personnel of the medical organization has been drawn from the best medical schools in the United States.

A rare animal parasite of man was described in 1914. This was a parasitic worm of the genus *Esophagostoma*, a worm which resembles in certain of its features the hookworm. The parasite produces cysts or tumors, generally in the large intestine, rarely in the small, which contains the immature adult worm. At maturity the cyst ruptures and the adult worm escapes into the lumen of the intestine. These ruptured cysts may be invaded by intestinal bacteria, with resultant ulceration, and sometimes perforation of the intestine. The study of this parasite, first described by Brumpt in 1905, was undertaken by the Bureau of Science at Manila.

Dr. Fantham described a new disease of the Sudan, a form of bronchitis due to a spirochete occurring in the respiratory passages of man. Very little is known of this peculiar organism, but natives and Europeans suffer from the disease, especially after the rainy season. Relapses are not uncommon, but the malady responds to treatment. Epidemic centres have already been found at Khartum, Omdurman, Kodok, and other widely separated places.

The Imperial Bureau of Entomology, started by the British Colonial Office, was doing excellent work in this branch of science. During the year 1914 it began to publish its *Review on Applied Entomology*, issued monthly in two divisions, one agricultural and veterinary, the other dealing with human subjects. This review is an abstract of papers published in many languages, including Russian and Japanese. The bureau also collected a complete set of laws and regulations against injurious insects in the British dominions and colonies. These were to be correlated and summarized. Some anxiety was felt with regard to the spread of yellow fever after the opening of the Panama Canal. Considerable traffic will be deflected from the yellow-fever-haunted American countries to the west of Asia; and should the *Stegomyia fasciata* be brought with it, an appalling outbreak of yellow fever might occur in India. The bureau was investigating the question whether the *Stegomyia scutellaris*, a mosquito, widely distributed, especially in Africa, carries yellow fever. The bureau secured the services of Mr. W. F. Fiske,

the well-known American entomologist, to carry out at the expense of the Nyassaland government, a thorough investigation into the bionomics of the tsetse fly, *Glossina morsitans*, which conveys sleeping sickness. The *Bulletin of Entomological Research*, which the bureau started at its foundation, contains records of original work only.

TRUST COMPANIES. See **LOAN AND TRUST COMPANIES.**

TRUSTS. In accordance with the administration programme, the enactment of the law reorganizing the banking and currency systems of the country, late in 1913, was at once followed by concentrated attention on a reasonable solution of the trust problem. On January 20, President Wilson delivered a message to Congress setting forth a programme of trust legislation. This included the prohibition of interlocking directorates; supervision of the issue of railway securities by the Interstate Commerce Commission; definition of acts deemed in "restraint of trade"; creation of a trade commission; fixing of penalties for those individuals guilty of restraint of trade; prohibition of holding companies; possible limitation of the voting power of persons holding shares in several corporations; and the establishment of the right of individuals to bring suits for damages against combinations found guilty of violating the anti-trust law. The message was mild in tone and assured the country of a desire to remove the evils of private monopoly with as little disturbance as possible.

The administration bills, four in number, were introduced by Representative Clayton of the House Judiciary Committee in January. These dealt with definitions of illegal acts; the granting of relief to persons injured by the operations of trusts; the checking of interlocking directorates; and the creation of an Interstate Trade Commission. A fifth bill relating to holding companies was afterwards introduced. Hearings were held in February, but they attracted little public interest. Thereafter various other bills were introduced in both House and Senate and various compromises and modifications were made in them with a view to harmonizing the ideas of leaders in Congress, the President, and his advisers. After prolonged discussion there were passed, in October, the Covington Trade Commission Bill and the Clayton Bill. These had been passed in a somewhat different form by the House in June, but Senate modifications delayed final passage several months.

CLAYTON BILL. On October 15 the new "Federal Anti-Trust Act," known as the Clayton Bill, was passed, and signed by the President. This was at the last moment vigorously opposed by certain Democrats on the ground that the force had been taken out of it. It was designed primarily to supplement the Sherman Anti-Trust Act by defining more explicitly legal and illegal actions. In its final form it was an omnibus measure in that it added, to sections for curbing trust activities, other sections for relieving labor organizations from anti-trust legislation. To the term "restraint of trade" which had been in use for many years, it added the phrase, "to lessen competition." The new law prohibits any firm from making different

prices between purchasers of its commodities, whenever such discrimination may lessen competition or tend to create monopoly. Numerous exceptions, however, are made on account of quantity or quality, differences in cost of selling or transportation, or the necessity of meeting competition. Obviously these numerous exceptions greatly weakened this section against price cutting. Another section makes it unlawful for a manufacturer to sell his goods to a dealer under conditions requiring such dealer not to handle the products of any other manufacturer; or factor's agreements are prohibited. Moreover, manufacturers of patented articles cannot require use of unpatented articles therewith, as in the mimeograph case. Decrees in government trust suits shall constitute prima facie evidence for the purposes of private suits for damages under the anti-trust laws. Moreover in the case of private suits the statute of limitations shall begin to run only from the date that decree is entered in the government suit. Holding companies are prohibited under a section which forbids one corporation holding the stock of another where the effect is "to substantially lessen competition" or to tend to create a monopoly. One corporation, however, may hold the stock of another solely for investment. Interlocking directorates are aimed at by provision prohibiting a person from being an officer or director of more than one bank, or of two or more large corporations which are competitors. Moreover common carriers may not deal with corporations having, in common, directors or officers with themselves, except by competitive bidding. The Federal Trade Commission noted below is entrusted with the execution of the provisions against price discrimination, exclusive trade agreement, holding companies, and interlocking directorates. Violation of penal sections of any anti-trust law constitutes an offense, not only on the part of the corporation, but also of the individual director, officer, or agent authorizing the act in question. The penalty for any individual offender convicted of such offense is fixed at a fine not exceeding \$5000, or imprisonment not exceeding one year, or both. See **TRADE UNIONS.**

TRADE COMMISSION ACT. This act created a Commission of five members to be appointed by the President with the advice and consent of the Senate, for terms of seven years each. Not more than three may be of any one political party. They will receive salaries of \$10,000 each, and the Commission's secretary will receive \$5000. This Commission will take over the Bureau of Corporations which was in fact expected to serve as an effective nucleus for the organization of the activities of the Commission. Investigations already begun by the Bureau were expected to be continued. Among these investigations, according to Secretary Redfield's annual report, those covering lumber, tobacco, agricultural implements, State corporation taxes, fertilizers, and petroleum remained uncompleted. Moreover, the Bureau contemplated inquiries into the economic character and effects of resale price maintenance, the efficiency of the trusts, and similar problems. The Trade Commission Act declared unfair methods of competition in commerce to be unlawful. Apart from definitions in the Anti-Trust Act above noted, the determination of what constitutes unfair methods was left to the Commission. This is similar to the power of the Interstate Commerce Commission to determine

what constitute reasonable and unreasonable railroad rates. The Commission whenever convinced that public interest requires its interference in cases of unfair competition may order a hearing; if the person or firm involved does not respond, the Commission may apply to the Circuit Court of Appeals for enforcement. Moreover, this Court is given exclusive jurisdiction and power of review as to the law, but not as to facts with respect to orders of the Commission. The latter has complete power to investigate all interstate corporations except common carriers and banks; it has access to all books and records, and may compel the giving of testimony. The Commission may require annual or special reports from any corporation or class of corporations. Penalties are imposed for failure to make reports. Thus the law is designed to secure the salutary effects of the greatly increased publicity. The Commission may publish information obtained by it, except trade secrets and the names of customers. On account of these large powers of inquiry the prohibition of unfair competition, of price discrimination, and of restrictive sales and leases is possible only through the Commission. The President, either House of Congress, or the Attorney-General may request the Commission to make investigations; moreover, the Attorney-General may request it to recommend the form of dissolution of combinations. A court may refer any suit to the Commission as a Master Chancery to ascertain and report the appropriate form of decree. This provision is expected to secure a more intelligent solution of the problem of reorganizing and dissolving large combinations, than was secured in the Standard Oil and Tobacco Trust dissolution decrees. The Commission may report to Congress, from time to time, recommendations for further legislation regarding corporations, combinations, and trade practices. The creation of such a Commission had long been favored by leading students of the trust problem. Inquiries sent to boards of trade throughout the country in 1914 showed an almost unanimous approval of the idea. This law was generally believed to be a great step forward in the organization and regulation of American industrial life.

SHIPPING TRUSTS. The House Committee on Merchant Marines, after two years of investigation, submitted in February a 14-volume report on domestic and foreign shipping of the United States. The Committee found that both kinds of shipping are controlled by agreements, pools, and conferences to such an extent that the disruption of these combinations would cripple the trade. It therefore recommended supervision and regulation by the Interstate Commerce Commission instead of dissolution. The Committee found that shipping lines on nearly every route operate under agreements designed to restrain competition and that these agreements result in advantages for both shipper and carrier. The incidental evils as to rates, rebates, and discriminations could be eliminated by supervision. Eighty agreements in foreign trade and 37 groups of bulk carriers in the domestic trades on the Lakes were found. The Committee did not believe that open competition could be restored for any length of time. It suggested that all agreements be filed with the Interstate Commerce Commission which should have authority to regulate rates and enforce fair treatment, and

which should be enlarged if necessary to meet these new demands.

PROSECUTIONS. In his annual report for 1914 the Attorney-General stated that between July 1, 1913, and Dec. 7, 1914, 16 cases under the Anti-Trust Law had been determined, 8 civil and 8 criminal. There were pending at the latter date 47 cases, 32 civil and 15 criminal. Of these 15 cases, 6 civil and 9 criminal, had been instituted during the Wilson administration.

One of the most important cases determined was that of monopolizing of the transportation facilities of New England by the New York, New Haven, and Hartford Railroad Company. The Department of Justice was preparing to make an attack upon this situation when, near the close of 1913, the new management of the Railroad Company requested that negotiations be entered into with a view to settlement of the monopoly question by mutual agreement. A plan of voluntary dissolution was finally agreed upon and entered in a final decree of the District Court on Oct. 17, 1914. This decree provided for the cancellation of the agreement between the New Haven Company and the New York Central for the joint operation of the Boston and Albany Railroad; for the relinquishment by the New Haven Company of its interests in trolley lines, and also of its interests in steamship lines between New England ports and other Atlantic ports. The question whether the steamboat lines on Long Island Sound should also be disposed of was to be submitted to the Interstate Commerce Commission.

Another important case involved numerous complaints that the American Telephone and Telegraph Company, known as the Bell System, was monopolizing means of communication by wire. The purpose of the Company to do this had been frankly admitted in its annual report for 1910. Moreover, it had achieved control of more than half of all the telephones of the country and through stock ownership dominated the principal telegraph company, the Western Union. In July, 1913, suit was instituted at Portland, Ore., charging the Bell Company with combining to monopolize telephone lines in Oregon, Washington, and Idaho. The officers of the Bell System, however, expressed a desire to bring their organization methods into harmony with the anti-trust laws. At the suggestion of the Attorney-General they agreed to the following, which was confirmed by court decree, March 26: To dispose of all Western Union telegraph stock; not to make any further acquisition of competing telephone systems; and to connect their long distance wires with the local exchanges of independent companies. This agreement was not construed to prevent the combination of two telephone companies competing in the same city or territory. Moreover, coöperation between the telephone and telegraph companies was not prohibited, but only their consolidation under one management.

The National Wholesale Jewelers Association on Jan. 30, 1914, was enjoined by the District Court of New York City from further conspiring to prevent manufacturers of jewelry from selling direct to retail dealers. A combination between the J. & P. Coats Co., Ltd., and affiliated corporations and the American Thread Company and affiliated corporations was dissolved by a decree of the District Court of New Jersey on June 2, 1914. These concerns were also enjoined

from engaging in certain unfair trade practices against independent thread manufacturers. The Attorney General believed this result would institute competition between these great thread producers and, moreover, permit independent manufacturers to enter the field. On June 22, 1914, the dissolution of the Eastern States' Retail Lumber Dealers' Association was affirmed by the Supreme Court. This Association was a combination of retail lumber dealers to prevent wholesalers from selling directly to consumers. The Elgin Board of Trade et al. was enjoined on April 27, by the District Court at Chicago, from continuing practices whereby the prices of butter throughout large areas were fixed arbitrarily. Similarly, the Chicago Butter and Egg Board et al. were, on October 12, enjoined by the same court from arbitrarily fixing and controlling the prices paid for butter and eggs throughout a large territory. The International Brotherhood of Electrical Engineers were permanently enjoined, on February 27, by the District Court of Chicago, from interfering with the interstate business of the Postal Telegraph Company. The Alaska Transportation Companies, the North British Wharves and Trading Company, and the Pacific and Arctic Railway and Navigation Company in February plead guilty respectively to conspiring to monopolize the wharf facilities at Skagway and to conspiring to monopolize steamship transportation between Puget Sound and Alaskan ports. They were fined a total of \$28,000. The case against officers and members of the United Mine Workers of America, instituted by the United States District Attorney in West Virginia without authority, was *nolle prossed* on June 20. The American Naval Stores Company, convicted in the District Court and fined \$17,500, while two individual defendants were sentenced to three months in jail, secured a retrial by means of a writ from the Supreme Court. This retrial in June resulted in a verdict of not guilty. The American Wringer Company et al., charged with conspiring to fix the price of clothes wringers, entered a plea of *nolo contendere* on November 13 and were fined \$6000.

Cases Still Pending. The following includes a summary of cases begun before July 1, 1913, but still pending on Dec. 7, 1914. The case against the United States Steel Corporation was argued before the Circuit Judges in New Jersey in October. The case against the International Harvester Company, argued in November, 1913, was decided in favor of the government on August 12. In the decree it was insisted that the parts into which the combination might dissolve should be separately owned and controlled by different sets of stockholders. Appeal was taken by the company to the Supreme Court. The Terminal Railway Association of St. Louis received a favorable decree from the Circuit Court on March 2. Appeal was taken to the Supreme Court by the government, the case being argued in October. Plans for carrying out the decree of Feb. 11, 1913, dissolving the Great Lakes Towing Company, had not yet been fully agreed upon. The taking of testimony against the American Sugar Refinery Company had been completed and the case was being prepared for trial. The Transatlantic Steamship Pool case was argued in April and a decision unfavorable to the government was rendered in October. Appeal was taken to the Supreme Court. Testi-

mony taking had been completed in the suit against the steamship lines to Brazilian ports (Prince Line et al.); so also in the suit against the American-Asiatic Steamship Company et al., operating lines to Far Eastern ports. There were several lumber cases similar to the one above mentioned being prepared for trial. The Soft Coal case, or the several suits against the soft coal-carrying road in Ohio and West Virginia was decided favorable to the government in December, 1912. Further decrees granting relief were given Nov. 10, 1913, and March 14, 1914. The civil suit against the United Shoe Machinery Company at Boston was completed in June, 1914, but decision had not been rendered. The criminal suit against the same defendants had been deferred. The appeal of the National Cash Register Company and individual defendants was argued before the Circuit Court of Appeals in October and decision was awaited. This was a criminal suit in which total fines of \$135,000 and jail sentences of nine months to one year had been imposed. A civil suit against the same defendants was awaiting the final disposition of the criminal suit. The Keystone Watch Case Company et al. were defendants in a case argued in June in which decision had not yet been rendered. The Associated Bill Posters and Distributors consented to a decree dissolving their combination. The Motion Picture Patents Company case was argued in November. The case against Wm. G. Geer et al., known as the paper-board case, was being prepared for trial. The suit against the Master Horse-Shoers' National Protective Association of America was not contested by some of the defendants and the demurrers of the others were overruled. The form of decree was under consideration. The criminal suit, begun in December, 1912, in the Federal District Court at New York City, against Charles S. Mellin and 20 other directors and officers of the New York, New Haven, and Hartford Railroad Company, charged with conspiracy to prevent construction by the Grand Trunk Railway Company of certain lines of railroad, and otherwise monopolize transportation in New England, was awaiting trial. Pleas of abatement by Wm. Rockefeller and 8 other defendants were overruled. In December, pleas of immunity were entered by 8 others on ground of previous testimony. The Kellogg Toasted Corn Flakes Company had moved that the suit against it be dismissed; this was argued in July and decision was awaited. The suit against the United Shoe Machinery Company of New Jersey was deferred, pending the outcome of a civil suit against the same company in Massachusetts. Other cases, begun before July 1, 1913, and still pending, were those against the following defendants: Board of Trade of the City of Chicago; the Cleveland Stone Company; the Lackawanna Railroad Company and the Lackawanna Coal Company, in which a decision adverse to the government had been appealed to the Supreme Court; the McCaskey Register Company; the Corn Products Refining Company; Terminal Railroad Association of St. Louis; Eastman Kodak Company; and the Quaker Oats Company.

The following cases still pending had been instituted since July 1, 1913: The Reading Company and affiliated corporations were charged in September, 1913, with restraining and monopolizing the trade in anthracite coal. The case was argued in the Circuit Court in June and de-

cision was awaited. A somewhat similar suit against the Lehigh Valley Railroad Company and other railroad and coal companies was begun in March, 1914, they being charged with monopolizing the production, transportation, and sale of coal from a specified region. Moreover, the railroad company was charged with transporting coal, in which it had an interest, in violation of the commodity clause of the Interstate Commerce Act. Decision was rendered by Judge Hough of the District Court December 21. He dismissed the suit on the ground that no monopoly or any attempt to monopolize was shown. The suit begun in November, 1913, against the American Can Company et al., charged with monopolizing the manufacture of tin cans, was in process, government testimony having been concluded. Cases begun in December against John P. White et al. and Frank J. Hayes et al. in the District of Columbia alleging a monopoly in mine labor in one case and, in the other, a conspiracy by workers to interfere with coal mining and transportation, were not prosecuted. In February the government brought suit in Utah against the Southern Pacific Company, Central Pacific Railway et al. to compel the former to relinquish its control of the latter on the ground that they were natural competitors. The taking of government testimony had been completed. A suit against Knauer et al., in Iowa, charging conspiracy to restrain trade in plumbing supplies, was set for trial December 8. Other cases, indictments for which had been returned in the later months of 1914, were as follows: The Booth Fisheries Company et al. were charged with combining to fix the price of fish in certain sections of Washington; the Western Cantaloupe Exchange et al. were charged with monopolizing interstate trade in cantaloupes; Collins et al., or 31 commission merchants, were charged with arbitrarily fixing the prices of country produce sold in the District of Columbia; McCoach et al., or 33 master plumbers and retail dealers in plumbing supplies, were charged with combination in Pennsylvania; Irving et al., or 14 master plumbers and retail dealers, were similarly accused in Utah.

TSETSE FLY. See SLEEPING SICKNESS; TROPICAL DISEASES.

TSINGTAO. See CHINA, *History*, under *China and the War*; and *WAR OF THE NATIONS*.

TUBERCULIN. Kutschera used tuberculin by what he terms the percutaneous method. He has the patient drop the tuberculin on his own skin and rub it in with his thumb until it has all disappeared. This method has proved particularly practical and effectual in some convents in his charge where 600 nuns have been taking this tuberculin treatment. It has demonstrated its usefulness in protecting against the flaring up of latent tuberculosis, but he advocates the more potent subcutaneous technic when the disease is already manifest. The percutaneous method is especially adapted for members of families exposed to tuberculosis, for large institutions, etc., as it is so simple and inexpensive that it can be applied in a wholesale manner. He begins with one drop of a 1:25 dilution of the tuberculin once a week. The dose is increased by one drop each week for four weeks. When the four drop dose has been reached he changes to a 1:5 dilution and so on, finally using one drop of pure tuberculin up to four drops. The treatment must be kept up for two years

after the last manifestations have subsided. The inunction is made at a different point each time. Once a month or three months is generally often enough for medical supervision. See EPILEPSY; TUBERCULOSIS.

TUBERCULOSIS. The year 1914 was marked by a recrudescence of the old operation of induced pneumothorax as a treatment for apical tuberculosis. The operation consists in puncturing the pleural cavity at its apex and injecting nitrogen gas with the aim of securing collapse and immobilization of the affected portion of the lung. The first operation of this kind is credited to James Carson, an English physiologist, who inflated the pleural sac of animals, and pointed out its probable value in pulmonary disease, but did not use it clinically. In 1889, Forlanini, an Italian physician, advised that pneumothorax be induced artificially, after he had noted a number of spontaneous cures by intercurrent pneumothorax. Ten years later Forlanini began to employ it, making his report in 1894. Meanwhile Murphy, of Chicago, devised and applied the same treatment in five cases, in all of which he reported improvement, in 1898. Since 1898 a number of clinicians both in Europe and America have tried out the method with varying fortune. Various gases have been tried, among them oxygen, carbon dioxide, and nitrogen. The latter being more slowly absorbed, as well as inert and non-irritating, is most suitable, and is therefore injected after it has been sterilized and filtered. The apparatus consists essentially of a rather dull hollow needle, which is thrust in between the layers of the pleura, a reservoir for the gas, and a manometer to determine the degree of pressure, which is indicated on a graduated scale. When sufficient pressure has been attained the needle is withdrawn and the operation is completed. The procedure must be repeated as frequently as is necessary to maintain collapse of the lung. Repetition may be required in from 2 or 3 days up to a month. Improvement may be looked for in 6 months, but the lung should be kept collapsed for a year, or even longer. As the gas is absorbed the lungs reexpand. Certain accidents may be expected. Pain occurring after injection, due probably to tension on pleuritic adhesions, is sometimes unavoidable, but does not last long. Subcutaneous emphysema sometimes takes place from coughing, straining, etc., or inducing too much pressure, and is due to leakage from the pleura back through the puncture into the subcutaneous tissues. When both lungs are affected bleeding from the opposite lung may rarely supervene. Puncture of the lung has no evil result, although it is to be avoided. Displacement of the heart and aorta, dyspnea, gas embolism and "pleural reflex," the two latter sometimes causing death, are enumerated among the possible accidents. Certain authors hold that pleural reflex is nothing more than embolism. Brauer examined post-mortem the brain under water and demonstrated bubbles in the blood-vessels. The symptoms of air or gas embolism are fainting, pallor, convulsions, temporary or permanent paralysis, and occasionally death. There is an international society called "Pneumothorax Artificialis," composed of physicians practicing this procedure, and a publication entitled *Revista delle Pubblicazioni sul Pneumothorace Terapeutico*, edited by Professor Forlanini. The treasurer of the society is Pro-

fessor Saugmen of the Vejleffjord Sanatorium, Daugaard, Denmark.

The final report of the government investigators of the Friedmann "remedy" was made public in October, 1914. It states that the cases showing improvement or cure, as observed by the physicians of the United States Public Health Service, were comparatively few. The government report was, therefore, in line with other reports coming from scientific sources in America and Europe and refutes Friedmann's claims to the discovery of a specific cure for tuberculosis. The report also disproves the claim that the inoculation of persons and animals with his organism is without harmful possibilities. An extensive series of animal experiments was made to determine whether or not the treatment was entirely harmless; 180 guinea-pigs, 30 rabbits, 16 monkeys, and 8 tortoises were used. The animals were weighed weekly and the temperatures of some were taken daily or twice daily. One monkey died after an inoculation with the Friedmann bacillus, showing tubercular lesions in the liver and spleen. The monkey was proved to be free of tuberculosis before inoculation. In a few instances the animals inoculated were apparently somewhat resistant to infection, but all showed tuberculosis at autopsy. Neither curative nor protective action against natural or inoculation tuberculosis was shown in monkeys. Acid-fast organisms were repeatedly found in previously healthy guinea-pigs over 100 days after treatment with the Friedmann organism. Later, the material used by Dr. Friedmann for the treatment of human beings was found to be at times contaminated with pus organisms. (Consult *Hygiene Bulletin*, 99, "On the Friedmann Treatment of Tuberculosis," Superintendent of Documents, Washington, D. C.). An editorial writer in Germany, discussing the views expressed at four meetings of the Berlin and Vienna Medical Societies, declares that never in the history of medicine has there been such a unanimous verdict of repudiation of an alleged curative measure as is the case with Friedmann's "remedy."

The relation of the foreign-born population to the tuberculosis problem is discussed by Dr. Rathbun, physician in charge of the Otisville Sanatorium, who calls attention to the fact that out of 1,197,892 immigrants admitted to this country at Ellis Island, New York, during the year 1913, only 38 were debarred on account of having tuberculosis. This represents but a small fraction of the immigrants actually tuberculous. The hospital and sanatorium figures tell a very different story. At the Bedford Hills Sanatorium 84 per cent of the patients are foreign born and most of them aliens; at the Metropolitan Hospital 51 per cent are foreign born and 25 per cent of these aliens; at the Riverside Hospital 45 per cent, at Otisville 42 per cent, and at the Seton Hospital 39 per cent are foreign born. As the population of New York City includes 40 per cent of foreign born people, the proportion of such patients in these institutions is considerably more than it should be. Dr. Rathbun suggests that the Federal government should appoint a committee to investigate this situation and to outline a more thorough system of examination. It cannot be considered proven, however, that all these immigrants enter the country with the disease. It is possible that under the stress of new economic conditions and

change of climate, as in the case of Italians, the disease is developed after arrival. See EPILEPSY; HOSPITALS; TUBERCULIN.

TUBERCULOSIS IN CATTLE. See DAIRYING.

TUCKER, ALFRED ROBERT. Formerly Bishop of Uganda, died June 10, 1914. He was born in 1849 at Windermere, England, was educated at Christ Church, Oxford, and in 1882 was ordained to the Church of England ministry. After a three years' curacy at Clifton he became a colleague of the Rev. H. E. Fox, known for his great interest in the Church Missionary Society, and during this service he determined to volunteer for work in East Africa. His letter asking for information about the country received the answer that already his name had been mentioned for the new Bishopric of Eastern Equatorial Africa. He was consecrated on April 25, 1890, and left for Africa on the same evening. His diocese comprised the vast territories which now form the two British protectorates of East Africa and Uganda, as well as a portion of German East Africa. This was divided in 1899, and Bishop Tucker's sphere was limited to Uganda and the surrounding districts. Upon the death of the Bishop of Uganda, Bishop Tucker was appointed his successor and he was for the first time able to start an effective mission in that country. His episcopate lasted for 21 years, and during that time Christianity made astonishing progress throughout the country. In 1911 Bishop Tucker visited England to plead for financial aid in the rebuilding of the cathedral and other buildings belonging to the mission which had been destroyed by an earthquake. He was offered the canonry of Durham and accepted that office, which he held at the time of his death. In 1908 he published an account of his life and work in Africa entitled *Eighteen Years in Uganda and East Africa*, a remarkable record of missionary enterprise.

TUFTS COLLEGE. An institution of higher education, founded at Medford, Mass., in 1852. The enrollment in the several departments in the autumn of 1914 was 1223, and the faculty numbered 242. During the year the university received from the estate of Henry J. Braker, \$354,034; from Thomas O. Hill, \$10,000; and from Hannah S. Moulton, \$10,149. The library contains about 72,000 volumes. During the year Hermon Carey Bumpus, Ph.D., Sc.D., LL.D., was elected president of the college.

TULANE UNIVERSITY OF LOUISIANA. An institution for higher learning, founded at New Orleans, in 1834. The total number of students enrolled in the several departments on Dec. 1, 1914, was 2610, and the faculty numbered 297. Professor Alcée Fortier, for many years head of the Department of Romance Languages, and dean of the Graduate Department, died Feb. 14, 1914, and Dr. Pierce Butler was elected dean of the Graduate School to succeed him. Dr. William Henry Seemann was elected dean of the School of Hygiene and Tropical Medicine, including Preventive Medicine, to succeed Dr. Creighton Wellman, resigned. Dr. Wallace Wood, Jr., was elected dean of the School of Dentistry, in place of Dr. Andrew G. Friedrichs, resigned. Mr. Charles Payne Fenner was elected dean of the College of Law in place of Prof. Dudley Odell McGovney, resigned. The School of Commerce and Business Administration was established in 1914 and Dr. Martin A. Aldrich

was elected dean. The only gift of any note during the year was that of the United Fruit Company of \$5000 for the support of the School of Hygiene and Tropical Medicine. The productive funds of the university at the close of the college year 1913-14 amounted to \$4,297,987, and the income, from productive funds only, to \$221,533. The library contained 68,700 volumes.

TUNGSTEN LAMPS. See **ELECTRIC LIGHTING**.

TUNIS. A French protectorate in northern Africa lying between Algeria and Tripoli. Area, 167,400 square kilometers, or 64,600 square miles, carrying a population estimated in 1911 at 1,929,003. The capital is Tunis, with 164,608 inhabitants, of whom 69,475 were Europeans.

Agriculture is the occupation of the people inhabiting the low regions, while in the mountainous regions are fertile valleys where grazing is carried on. The principal agricultural products are cereals, olives, and vines. Horses at the end of 1911 numbered 39,441, donkeys 80,951, mules and hinnies 13,289, camels 110,707, cattle 191,450, sheep 686,730, goats 468,828, swine 17,898. The area under principal crops and the yield for two years are given below, with the yield per hectare in 1912-13.

	<i>Hectares</i>		<i>Quintals</i>		<i>Qs.</i>
	<i>1912-13</i>	<i>1913-14</i>	<i>1912-13</i>	<i>1913-14</i>	<i>ha.</i>
Wheat	500,000	428,000	1,500,000	600,000	3.0
Barley	400,000	346,000	1,400,000	700,000	8.5
Oats	54,000	40,000	600,000	100,000	11.1
Corn	10,000	20,000	2.0
Vines *	15,000	17,500	800,000	20.0

* Yield in hectoliters of wine.

By countries of origin and destination the trade for 1912 is given below in thousands of francs:

	<i>Imps.</i>	<i>Exps.</i>		<i>Imps.</i>	<i>Exps.</i>
France	80,265	67,773	Swits. ...	1,694	11
Algeria	17,835	7,738	Neth's ...	272	5,275
U. K.	14,544	13,752	Turkey ...	1,683	63
Germany ..	3,046	3,861	Egypt ...	477	453
Aus.-Hun. .	2,155	1,643	Tripoli ...	468	7,257
Belgium ...	3,282	9,057	U. S.	6,593	27
Italy	8,972	25,256	Brasil ...	1,589	5
Malta	256	2,379	Argentina	1,894	...
Spain	1,158	2,400	Other ...	8,915	5,818
Portugal ...	80	1,558			
Sweden ...	1,116	829			
			T ^l 1912.	156,294	154,655
			T ^l 1911.	121,688	143,681

The budget for 1913 estimated the revenue at 85,012,400 francs and the expenditure at 85,002,322 francs. Reigning Bey, Side-Mohammed-en Nasser. A French resident-general administers the country under the control of the foreign office.

TUNNELS. During 1914 two notable tunnels were under construction in America. The Chicago, Milwaukee, and St. Paul Railway was completing the 2½-mile Snoqualmie tunnel through the Cascade Mountains, making use of a novel type of construction, in which a bottom heading was driven, and the material as excavated from above was trapped into cars in the lower drift. The Canadian Pacific was driving a 5-mile tunnel through the Selkirk Mountains under Mt. McDonald, using a separate parallel or pioneer tunnel with cross cuts to the main tunnel at frequent intervals. The object of both these methods was to make possible driving the tunnel from several faces at the same time, and thus increase the speed of the work. These two projects represented the latest developments

in railroad tunnel construction, where progress has been exceedingly rapid, due largely to the development of electric construction, and the installation of artificial ventilating systems. Current criticism of tunnel construction elicited the fact that the reduction of cost had not been as rapid as in other fields of railway work. Other railways reconsidered the construction of tunnels to cut down grades as well as for cut-off, and it was exceedingly probable that within a few years the American lines would consider further work in this direction.

SNOQUALMIE TUNNEL. This tunnel, 2½ miles in length, passing through the Cascade Mountains between Rockdale and Keschelus, about 60 miles east of Seattle, was approximately completed at the end of the year, the headings having met on August 4, and its use for regular service of trains was to be begun in 1915. The cost of the tunnel was figured at \$2,000,000, but the saving in snow fighting alone on the former line was estimated at \$175,000 a year. The material encountered in constructing this tunnel was varying kinds of rock with about 75 per cent of the distance through hard slate, the remainder being quartzite and granite. The new tunnel effected the saving of 443 feet of elevation and 1239 degrees of curvature.

ROGERS PASS TUNNEL. The Canadian Pacific Railway had under construction a 5-mile tunnel as an essential portion of the improvements of its main line where it crosses the summit of the Selkirk Range at Rogers Pass. There was being built an entirely new line for a distance of 18 miles with a marked improvement in grade, as the summit was to be 540 feet lower than the old line, together with a saving of 5 miles in distance, in addition to eliminating a stretch of line where snow was a great difficulty, and long stretches of snowsheds were required. There were nearly 5 miles of snowsheds in 13 miles, which would be reduced on the new lines to 4800 feet. The total curvature was also reduced and the maximum grade of 2.2 per cent was decreased from 46 to 29 miles. The tunnel is 26,400 feet long, and it was being built without intermediate shafts. For 1100 feet at each end the material is clay and bowlders and the remainder was expected to be solid rock, mica, schist, and quartzite. The maximum depth of rock above the tunnel was 5690 feet. The tunnel was to be 24 feet high and 29 feet wide, with a concrete lining through the softer materials. A pioneer heading was being driven 45 feet from the centre line of the main tunnel, with its head 10 feet above the subgrade of the latter. From this pioneer tunnel cross cuts were being made to the line of the main tunnel at convenient distances of 750 to 1000 feet apart, and drifts from these cross cuts were to be driven along the centre line of the main tunnel from which drilling and blasting could be carried on, while mucking was being done with air-operated shovels in the enlarged section of the main tunnel. The muck was being handled by 16-yard side-dump cars and compressed air locomotives. During the month of December the west end of the tunnel was driven 852 feet and the pioneer tunnel at the east end 544 feet. The centre heading of the west end of the main tunnel proper was driven 686 feet and the east end 523 feet, and work was being started on the enlargement of the centre heading in the east end to the full section. It was the intention to

operate the trains by electricity after the tunnel was completed.

NEW YORK SUBWAY TUNNELS. In New York City the East River tunnels of the New York Rapid Transit Lines were put under construction, being two pairs of tunnels consisting of cast iron tubes of essentially the same type that had been used in other parts of the subway system. The length of the southerly pair of tubes was essentially 4090 feet and the northerly 3799 feet, the former running from Whitehall Street, Manhattan, to the foot of Montague Street, Brooklyn, and the northerly pair from Old Slip, Manhattan, to the foot of Clark Street, Brooklyn. (See RAPID TRANSIT.) The excavation was to be under pneumatic pressure, and it was hoped that the United States government would remove the Coenties Reef overlying the tunnel at the Manhattan end as this impediment to navigation could be removed only with great difficulty and danger after the completion of the tunnel. In constructing the Harlem River tunnel of the Lexington Avenue Subway the same plan of construction was followed as in building the Michigan Central tunnel under the Detroit River several years previously, namely, of building successively sections of steel tubes somewhat larger in diameter than the completed tunnel, and then sinking them in position in a trench dredged along the line and filling above, around, and below the steel tubes with concrete, then pumping the water from the interior of the tubes and adding the concrete lining. The last section of the Harlem River tunnel was successfully sunk in September. A main advantage of this process was that the tunnel could be placed so near the surface of the river bed, in this particular case the top of the structure being only 7 feet lower than the original river bed.

ALLEGHENY SUMMIT TUNNEL. On the Virginian Railway the Allegheny Summit tunnel between Yellow Sulphur and Merrimac, Va., which was 5176 feet in length, received during the year a ventilating system of two fans, which force the air at high velocity through the tunnel. This work facilitates materially the use of the tunnel, especially for west-bound trains, and the smoke is driven ahead of the engines, thus giving good ventilation under ordinary operating conditions.

CALIFORNIA. A 2-mile street railway tunnel at San Francisco under Twin Peaks was planned during the year and the contract awarded. This would provide for a double-track electric railway and give access to an area of 7000 acres suitable for residences, and within 5 minutes' ride of Market Street, the east portal. The west portal would open up in the centre of the new Home-side tract, the length between portals being 12,000 feet. The estimated cost, including right of way, was \$3,994,289. It was expected that sandstone and sand clay would be the principal material encountered, and the tunnel was to be lined with brick or concrete in the upper portion of the arch ring, and concrete in the remainder of the section.

In constructing the Stockton Street tunnel at San Francisco numerous problems had to be solved, due to the enormous weight of the shattered shales and schist, which had to be supported, though a small portion of the tunnel was through sandstone, and presented no difficulties. The work involved the erection of sub-timbering

false work to carry the ground surface until the concrete lining was in place.

The Mount Shasta Power Corporation was engaged during the year in constructing a 7-mile tunnel to carry water from the Pitt River in Shasta Mountain, Cal., to the forebay of its projected powerhouse, the tunnel being 7 feet wide and 9 feet high, later to be enlarged to a width of 16 feet and a height of 19 feet. This tunnel was being worked from both ends and the entire length was to be completed to a 7x9 foot section before being enlarged. This was said to be the longest tunnel in America.

OHIO. At Cleveland, Ohio, a tunnel to extend the West Side intake into Lake Erie, 16,000 feet beyond the existing crib No. 4, which is $1\frac{1}{4}$ miles from the shore, was under construction during the year. This tunnel was excavated by a clay tunneling machine, which was followed by an erector, which placed concrete blocks of cyclopean dimensions in rings. The extension was 100 feet below the water surface level and 50 feet below the ground surface. This work was in connection with an extension of the Cleveland Water Supply System. See AQUEDUCTS.

SWISS TUNNELS. The Munster-Grenchenberg tunnel in Switzerland was successfully pierced on October 27. This tunnel runs through the Jura Mountains, and is 5½ miles in length, thus making it longer than the Hauenstein Base tunnel, pierced on July 10, 5 miles, 94 yards in length. No special engineering difficulties were encountered, but two serious strikes occurred and the mobilization of the Swiss army interrupted the work, from August 1 to September 22, although the workmen were almost entirely Italians. It was thought the new line would be completed within 3 years and 6 months. The tunnel was built by the Bernese-Alpine Company (Lötschberg Company) and its completion in 1915 was anticipated. The Chemin de Fer de l'Est and the Lötschberg line will benefit by the Munster-Grenchenberg tunnel, which will afford the most direct route via Delle to the Lötschberg and the Simplon lines, and Italy, being 10½ miles shorter than the previous line, or about 40 minutes less in time consumed. The line was being laid with a single track for steam construction and was operated by the Swiss Federal railways. It will form an important link in the main line from Belfort to the Rhone Valley.

INDIA. The longest tunnel in India is the one piercing the Khojak Range between Quetta and Chaman near the northwestern frontier. It is 12,870 feet in length. The second longest tunnel, 3900 feet in length, was being driven during the year on a double track cut-off between Thana and Diva. This by piercing a part of the Parsik Hill reduced the distance 11 miles from that of the existing line, and was to be used for through traffic.

TURBINES. See INTERNAL COMBUSTION ENGINES; STEAM TURBINES.

TURKEY, or the OTTOMAN EMPIRE. Previous to the war in 1911-13 with Italy and the Balkan States, a vast empire, comprehending extensive possessions in southeastern Europe, southwestern Asia, and northeastern Africa. Capital, Constantinople.

AREA AND POPULATION. The close of the year 1913, which marked the conclusion of the war of the Balkan allies against Turkey, saw the division of the majority of the Turkish possessions

in Europe among the Balkan States of Bulgaria, Servia, Montenegro, and Greece, and the establishment of the independent State of Albania (q.v.). Greece and Italy occupied the Aegean Islands, although up to May, 1914, no definite provision had been made with regard to their ultimate disposal. Out of an original European area of 169,300 square kilometers, or 65,367 square miles, carrying a population estimated at 6,130,200, Turkey retained only 10,882 square miles, with 1,891,000 inhabitants (Constantinople vilayet, 1505 square miles and 1,202,000 inhabitants; Tchataldja mutessarifat, 733 and 78,000; Adrianople vilayet, 8644 and 610,000). Mohammedans preponderate in this territory. The city of Constantinople has 942,900 (with suburbs, 1,200,000) inhabitants; Adrianople has 123,000.

The great divisions of Turkey in Asia are Asia Minor, Armenia and Kurdistan, Syria and Mesopotamia, and Arabia. Their total area and estimated population by vilayets and mutessarifats is shown in the table below with density per square kilometer:

	Sq. km.	Pop.	D.
Archipelago	6,900	322,800	54
Ismid *	8,100	222,700	39
Bigha *	6,600	129,500	26
Brussa	66,800	1,626,800	26
Smyrna	55,900	1,896,500	34
Konia	102,100	1,069,000	18
Adana	89,900	422,400	12
Angora	70,900	982,800	16
Kastamuni	50,700	961,200	21
Sivas	62,100	1,057,500	19
Trebizond	32,400	948,500	44
Total Asia Minor	501,400	9,089,200	21
Erzerum	49,700	645,700	16
Mamuret-ul-Asis	32,900	575,200	14
Bitlis	27,100	398,700	15
Diarbekr	37,500	471,500	11
Van	39,800	379,800	7
Total Armenia and Kurd.	186,500	2,470,900	18
Aleppo	86,800	995,800	11
Beirut	16,000	533,500	45
Lebanon *	8,100	200,000	161
Jerusalem *	17,100	341,600	22
Syria	95,900	719,500	9
Zor *	78,000	100,000	1

Mosul	91,000	351,200	3
Basra	138,800	438,000	3
Total Syria and Mes.	637,800	4,288,600	8
Hejas	250,000	300,000	1
Yemen	191,100	750,000	4
Total Arabia	441,100	1,050,000	3
* Mutessarifat.			

No census has ever been taken of the hordes of nomad tribes, whose subjection to Turkey is merely nominal. Reliable population figures by races are unobtainable; in a country so disorganized no attention has been paid to the compilation of accurate statistics, and though foreign statisticians have attempted numerous calculations, no two agree. Mohammedans form the majority of the population; Orthodox Greek Christians predominate in some districts, notably Macedonia, and Gregorians in Armenia; there are also Roman Catholics, Jews, Nestorians, etc. Mohammedan priests are estimated to number about 11,600 and are subject to the sheikh-ul-Islam, appointed by the Sultan; their priestly office is, however, hereditary. No accurate official census having been taken, the following figures for the population of principal

cities must be regarded as estimates: Damascus, 250,000; Smyrna, 250,000; Aleppo, 200,000; Beirut, 140,000; Bagdad, 125,000; Erzerum, 120,000; Afium, 95,000; Manissa, 90,000; Jerusalem, 84,000; Aidin, 80,000; Brussa, 80,000; Diarbekr, 80,000; Mosul, 80,000; Siva, 78,000; Urfa, 72,000; Aintab, 70,000; Mecca, 70,000; Basra, 60,000; Trebizond, 60,000; Adana, 50,000; Homs, 50,000; Hodeida, 49,000; Angora, 38,000; Tripoli, 32,000.

Primary instruction, which is nominally compulsory for Mohammedans, is intrusted to the clergy attached to the mosques and is confined mainly to the reading of the Koran. Under the law of Oct. 6, 1913, all children from six to sixteen are to receive primary instruction either in State schools, community or private schools, or at home. Provision for government inspection is made.

In Africa, Tripoli and Bengazi were lost to Turkey at the close of the Turco-Italian War, and Great Britain proclaimed a protectorate over Egypt, Dec. 18, 1914.

PRODUCTION. The empire contains much soil of exceeding fertility, but agricultural methods are primitive; and any incentive to the development of a modern system is hindered by the tithe system and by customs dues on produce exported from one province to another. The State holds title to the greater part of the agricultural land, which it leases for a "tithe," which with the supplemental payments required amounts to about 12 per cent of the gross produce harvested. This class of property is known as "miri." The tax-gathering is farmed out. The title to property known as "vakuf" is held, not by the State, but by some religious or charitable institution ("pious foundation") from which it is inalienable. This form of property is usually urban, nearly all of Constantinople being held under this tenure. There is also simple freehold tenure, but in comparatively small amounts. The labor problem is acute. Olive oil and wine are important products, and sericulture is carried on. In Asia Minor goats are numerous, and mohair is a leading export. Cereals are grown as well as tobacco, cotton, nuts, and various fruits. The world's supply of true Mocha coffee is a production of the Yemen Arab. Opium of a superior quality is produced. There are rich mineral deposits which are not worked, and fertile tracts through which no railroads run. Copper is mined near Trebizond and, on a larger scale, near Diarbekr. The extensive coal deposits of Heraclea, on the Black Sea, are exploited in a small way. Other minerals are chrome ore, silver-lead ore, zinc, manganese, antimony, emery, petroleum, salt, gold, mercury, arsenic, etc. Manufactures, in the western sense, are few and unimportant.

COMMERCE, ETC. By countries of origin and destination, statistics for 1911 (the latest available) are given below in thousands of piasters:

	Imps.	Exps.
United Kingdom	820,518	525,520
France	888,229	439,451
Belgium	145,607	61,337
Netherlands	79,527	38,889
Germany	329,073	130,862
Austria-Hungary	755,881	216,913
Italy	368,497	147,785
Greece	28,714	38,152
Bulgaria	103,677	74,316
Rumania	106,602	52,910
Russia	273,581	91,189
Servia	46,034	30,068

	<i>Imps.</i>	<i>Exps.</i>
Persia	69,098	4,452
British India	198,198	25,458
Egypt	114,368	156,525
United States	63,394	100,697
Other countries	141,646	54,810
Total, 1911	4,012,574	2,198,789
Total, 1910	3,593,603	1,829,927

Trade statistics for the empire are incomplete and unreliable, Turkey's returns differing widely when compared with the returns of countries of origin and destination. The principal domestic exports from the United Kingdom to Turkey, and imports from Turkey to the United Kingdom, are given below according to Board of Trade Returns, for three years:

<i>Exports from U. K.:</i>	<i>1910</i>	<i>1911</i>	<i>1912</i>
Coal and coke	2374,637	2352,708	2278,136
Cotton yarn	838,324	487,841	588,110
Cottons	5,280,893	5,792,596	4,919,741
Woolens	940,478	704,150	556,084
Iron mfrs.	201,608	274,147	211,775
Machinery	284,017	375,274	315,148

<i>Imports from Turkey:</i>	<i>1910</i>	<i>1911</i>	<i>1912</i>
Barley	2491,401	21,397,443	21,441,286
Raisins	383,768	526,728	820,464
Angora hair	704,520	404,318	637,125
Wool	267,005	327,876	235,986
Woolens	270,648	266,811	275,592
Opium	291,702	274,140	252,288

The total trade of the empire for 1912 with the United Kingdom is given at £14,539,852; with Germany, £9,070,325; with France, £7,302,431; with the United States, £5,209,474.

There entered and cleared at Constantinople in 1912, 18,318 vessels, of 15,080,562 tons. This number included, in the foreign trade, 3706 sailing vessels of, in the aggregate, 196,784 tons; 1357 steamers of 2,507,886 tons sailing regularly, and 7678 steamers of 11,941,258 tons not sailing regularly; in the coasting trade, 3261 sailing vessels, of 73,901 tons, and 2316 steamers, of 360,733 tons. The merchant marine in 1911 included 120 steamers, of 66,878 tons, and 963 sail, of 205,641 tons.

COMMUNICATIONS. In the following list, the lines with an asterisk have a kilometer guarantee. In Europe the Salonica-Monastir Railway* was reported Jan. 1, 1913, to have 136 miles in operation; the Constantinople-Salonica,* 317; the Oriental Railways, 593—a total of 1046 miles. The Asiatic lines were: Haidar-Pasha-Angora,* 358 miles; Eshki-Shekir-Konia,* 283; Mudania-Brussa, 25; Smyrna-Cassaba,* 165; Alasheir-Afion-Karahissar, 156; Smyrna-Aidin, 320; Konia-Eregli-Persian Gulf,* 125; Mersina-Adana, 42; Beirut-Damascus, 96; Rayak-Aleppo,* 295; Damascus-Medina, 812; Jaffa-Jerusalem, 54; Haifa-Deraa, 105—a total of 2836 miles in Asiatic Turkey. The German concession of the Bagdad Railway is to extend the Anatolian line from Konia to Adana, Mosul, Bagdad, and Basra, with numerous branch lines and an extension to the Persian Gulf. It has been finished as far as Bulgurlu, about 15 miles beyond Bregli. The extension of the Haifa line to Deraa connects with the Mecca Railway. Projected lines contemplate 628 miles of line and 440 of junction line in Europe and 4940 in Asia.

It was reported at the end of the year that a section of the Smyrna-Cassaba Railway had been destroyed by the Turkish military authorities, rendering the operation of the railway from Smyrna impossible.

FINANCE. The unit of value is the Turkish

piound of 100 piasters; par value, \$4.39642. The details of the 1912-13 budget are as follows: £T14,870,381 revenue from direct taxes, £T5,692,728 indirect taxes, £T1,361,886 stamps, etc., £T3,621,373 monopolies, £T301,867 State enterprises, £T893,877 tribute, £T1,178,513 pensions, £T868,764 domains, £T1,724,770 various—a total revenue of £T30,514,159. Total expenditure, £T57,164,450, disbursed as follows: £T15,790,983 finance and debt, £T21,601,453 war, £T6,046,000 marine, £T3,899,633 public works, £T4,037,287 administration, £T1,143,648 instruction, £T497,700 indirect taxes, £T505,880 civil list, £T218,711 legislature, £T264,079 foreign affairs, £T118,195 survey, £T789,566 justice and worship, £T484,858 agriculture, £T858,000 posts and telegraphs, £T523,288 sheikh-ul-Islam, £T25,170 court of accounts. The total debt stood, Sept. 24, 1912, at £T149,147,062. Nominal capital in circulation, £T131,839,978.

ARMY. Turkey after its defeat in the Balkan War of 1912 naturally was involved in considerable army reorganization, the German drill masters still being retained. Much of the military organization was kept secret since that war, especially with regard to the *Redif* (reserves), but it was the opinion of military observers that the Turkish forces were distributed in 13 army corps and 2 independent divisions, and that the whole of the Turkish Empire was divided into 4 army inspections, viz.: Constantinople, Erserindjan, Damascus, and Bagdad. The probable distribution of these 13 army corps in 1914 was as follows: Constantinople, Adrianople, Rodosto, Smyrna, Konia, Aleppo, Yemen, Damascus, Erzerum, Erserindjan, Van, Mossul, and Bagdad. On a peace basis each army corps would consist of 3 divisions of 3 regiments each, each having 3 battalions. Each division, in addition, would have one chasseur battalion and one artillery regiment of 2 corps each, each corps consisting of 2 battalions. Every regiment was to have a machine gun company, and each army corps from 1 to 2 cavalry regiments. The aeronautical sections and technical troops were also being trained and developed. The total strength of the Turkish army available for a European war was approximately 246 officers, 1300 officials, 600,000 men, 80,000 horses, 1048 guns, and 430 machine guns, while for a war in Asia it was believed that there would be 7000 officers and officials, 400,000 men, 50,000 horses, 500 guns, and 100 machine guns available. Every Turkish subject is liable for service, this obligation resting on Christian and Mussulman alike, as was the case originally. The Christian enrollment, however, was made comprehensively, and such recruits were usually sent away from their native districts. Towards the latter part of the year and especially when Turkey, joining with Austria and Germany, declared war on Russia, there was little information available as to the strength and organization of the Turkish army.

NAVY. The effective fleet, in October, 1914, included 4 battleships, 2 protected cruisers, 2 torpedo craft, 15 gunboats, 8 torpedo boat destroyers, and 16 torpedo boats. At the Vickers firm in Barrow a super-dreadnought of 23,000 tons displacement, 21 knots speed, and a main armament of 10 13.5-inch guns, besides 16 6-inch guns, and 5 torpedo tubes, was launched, September 3, 1913; but on the declaration of war she was bought by Great Britain (renamed *Erin*), as was also the *Osman I*, completing at

Elswick (renamed *Aginocourt*). The *Goeben* and the *Breslau*, reported in the first days of the war as sold to Turkey, retained their German crews and officers, were repaired under German direction, and put out into the Black Sea under German command. At the end of September, 1914, the British naval mission under Rear Admiral A. H. Limpus returned to England. The war personnel included, in October, 1914, about 13,000 officers and men.

GOVERNMENT. The fundamental laws of the empire are based on the precepts of the Koran, and the Sultan exercises both temporal and spiritual authority. A grand vizier, appointed by the Sultan, forms the cabinet. At the head of ecclesiastic affairs is the shiekh-ul-Islam, under the direction of the Sultan. The legislative body is composed of a Senate and a Chamber of Deputies. Reigning Sultan, in 1914, Mohammed V, born 1844, succeeded April 27, 1909. Heir-presumptive, Yussuf Izzedin, son of Abdul Aziz, born 1857. The cabinet as reconstructed after the assassination of the grand vizier, Mahmud Shevket Pasha, in June, 1913, was composed as follows: Said Halim Pasha, grand vizier and minister for foreign affairs; Haid Bey, shiekh-ul-Islam and minister of pious foundation; Talaat Bey, interior; Ibrahim Bey, justice; Ahmed Mahir Bey, president of the Council of States; Brig. Gen. Enver Pasha, war; Mahmud Pasha, marine; Javid Bey, finance; public works, vacant; Shukri Bey, instruction; Ahmed Nessimi, commerce, agriculture, and mines; posts and telegraphs, vacant; Emin Bey, under-secretary of state for the grand vizier.

HISTORY

ENVER BEY AND THE ARMY. At the beginning of January, 1914, Enver Bey was given the portfolio of war in the Turkish cabinet and promoted to the rank of brigadier general, with the title of "Pasha." As a conspicuous Young Turk, Enver Pasha, as he was now called, was expected to use his official powers in order to strengthen the hold which the Committee of Union and Progress had upon the army; but public opinion was not quite prepared for the sweeping exercise of power with which he inaugurated his administration. Assuming to himself the office of chief of the general staff, and calling to his side Hafiz Hakki Bey (former military *attaché* at Vienna), Enver Pasha proceeded to place on the retired list almost 300 army officers, among whom were Ibrahim Pasha, Mahmud Mukhtar Pasha, and other famous leaders. Over 500 subalterns and 200 civil employees in the department of war were also discharged. A second feature of Enver Pasha's régime in the war office was the predominance of German influence. Enver Pasha himself had served as a military *attaché* in Germany, and his most trusted lieutenant had been military *attaché* at Vienna. Arrangements were made for a German military mission to Turkey, and the German general, Liman von Sanders, was to assume command of the first Ottoman army corps while directing a thorough reorganization of the Turkish land forces. So strenuous a protest was made by Russia and the other powers of the Triple Entente against this triumph of German military influence, that General von Sanders was deprived of his command and installed as inspector-general of the Ottoman army, with the rank of marshal, for five years.

With the aid of other German officers, during the summer of 1914, he carried out a general reform and redistribution of the Turkish army.

ARMENIAN TROUBLES. Early in February the Russian chargé d'affaires, M. Gulkevitch, arrived at an understanding with the grand vizier, Prince Said Halim, regarding reforms for the six Armenian vilayets, but details of the understanding were not announced. Somewhat later reports were received to the effect that the Turkish government and the Armenian patriarch had agreed on Armenian participation in the general elections, the Armenians receiving 16 seats in the chamber. The agreement thus heralded, like so many previous Armenian agreements, did not put an end to the periodic outbreak of civil strife between the Kurdish tribesmen and the Armenian Christians, for in April the town of Bitlis was attacked by the Kurds and new "Armenian atrocities" were committed.

FRANCO-TURKISH LOAN CONVENTION. A Franco-Turkish Convention was signed in Paris on April 8-9 by M. Doumergue and Djavid Bey, according to which: (1) France granted to Turkey a loan of 800,000,000 francs (\$160,000,000), of which no part was to be used for war-expenses; (2) France agreed to support the fiscal reorganization of Turkey and to recognize, subject to the approval of the other Powers, a four per cent increase in the Turkish tariff, and the creation of monopolies for alcohol, matches, playing cards, etc. In return, France obtained from Turkey concessions (1) in Syria for some 900 kilometers of railway, and the ports of Jaffa, Caiffa, and Tripoli-in-Syria, and (2) in Armenia for some 2000 kilometers of railway and the ports of Heraclea and Ineboli. Before the war broke out in August only half of the first installment of the loan had been paid by France.

PARLIAMENT. The Turkish Parliament was formally opened on May 14. Fuad Bey, first secretary of the palace, read the Speech from the Throne, rehearsing the events which had transpired since the dissolution of the preceding Parliament on Aug. 4, 1912; affirming the impossibility of allowing Greece to retain the *Ægean* Islands so necessary to Turkish control over Asia Minor; declaring that the vilayet or provincial administration must be reformed and subjected to the inspection of international controllers; insisting upon the prime necessity of a strong fleet; and congratulating the empire upon the financial convention recently concluded at Paris. Hali Bey, who was elected Speaker of the Chamber of Deputies, in his inaugural address eloquently urged his fellow-countrymen never to forget and never to abandon the lost provinces of Salonika, Monastir, Janina, Scutari, Kossovo, and Uskub. In his Budget Speech in July, Djavid Bey referred with satisfaction to the loan agreement with France, and to similar negotiations pending in London and Berlin, with regard to increasing the customs duties and establishing various government monopolies.

TURCO-GREEK CRISIS. During the spring and summer of 1914, relations between Turkey and Greece became strained almost to the breaking point. The two Balkan Wars and the treaty of Bucharest (Aug. 10, 1913) had resulted in the annexation by Greece of a large part of Macedonia and the *Ægean* Islands which had hitherto been under Turkish rule, and undoubtedly contained a considerable sprinkling—whole villages in certain localities—of Mohammedans. There

were also numerous communities of Greek people living in Turkish Thrace and Asia Minor. After the war these minorities, the Turks in Greek Macedonia and the Greeks in Turkish Anatolia (which is the same as Asia Minor), found their position most uncomfortable, in the midst of a hostile nation and under the rule of an unfriendly government. Consequently large numbers of Turkish villagers began to emigrate from the new Greek provinces in Macedonia, and to settle in what remained of Thrace under Turkish rule, or in Asia Minor. Frequently, upon arriving in Asia Minor, they would take forcible possession of the homes of Greek villagers living there, as compensation for the homes left in Macedonia; and, in the excitement of national hatred, riots occurred, accompanied by looting, murder, and rape. At Phocæa in Asia Minor about 50 Greeks, and at Serekeui about 40 Greeks were massacred. In a panic of fear thousands and tens of thousands of Greeks fled from Asia Minor to Greece. In May the Ecumenical Patriarch, his Holiness Germanos V, appealed to the Sultan to remedy the Greek grievances. In June, as a further protest, the Patriarch closed all Orthodox churches and schools. The situation was becoming serious. An anti-Greek boycott still further inflamed national animosities in Asia Minor, and steady streams of angry immigrants continued to flow from Greece into Asia Minor and from Asia Minor into Greece. On June 12 the Greek government delivered a note remonstrating against the mistreatment of Greek inhabitants of Asia Minor. The reply vouchsafed by the Porte (June 18) laid the blame on Greece, insisting that the regrettable incidents in Asia Minor were caused by the influx of 200,000 destitute Turks who had been forced by the Greeks to leave their homes in Macedonia. Greece and Turkey appeared to be on the verge of war. Two other factors in the situation ought to be mentioned. First, there were the *Ægean Islands*, which Greece had occupied during the Balkan War and which she was determined to retain, Turkey being no less determined to regain them. And, secondly, there was growing up a dangerous rivalry between the Greek sea power and the Turkish fleet. In January Greece was excited by the announcement that Turkey had purchased two dreadnoughts which were being constructed in British naval yards, one from Brazil and the other from Chile. In addition to the *Sultan Osman* and the *Reshadieh*, as these two powerful ships were to be named, several smaller vessels were also to be added to the Turkish navy. The "Jingo" Press in Greece urged an attack on Turkey before the latter had received her new ships. Instead of attacking, Greece entered into competition with her enemy, by purchasing, in July, the *Idaho* and the *Mississippi* from the United States. The purchase was well calculated to dampen the ardor of the Young Turk Chauvinists, and at the same time to moderate the panic which had been occasioned in Greece by the anticipation of an increase in the Turkish fleet. Moreover, Serbia delivered a timely warning in Constantinople that in case of a Greco-Turkish conflict, Serbia could not remain on friendly terms with the Ottoman Empire. And presently Russia and Rumania advised the Porte that they would consider it a serious blow to international trade if the Dardanelles should be closed in event of a Greco-Turkish war. Bulgaria apparently intended to remain neutral, and thus practically

to prevent a war on land. All these considerations made for peace. A supplementary Turkish communication to Greece on the subject of the dispossessions in Asia Minor, was more conciliatory than the first Turkish reply had been; it proposed an exchange of properties between the Greek refugees from Asia Minor and the Turkish fugitives from Macedonia. A second Greek note, couched in conciliatory but firm language, contributed still further to an understanding. The excitement in Asia Minor had by this time been much allayed by a visit of the Turkish minister of the interior, Talaat Bey. While anxious as far as possible to make amends to Greece, Talaat Bey pointed out that it would cost the Turkish government about a hundred million dollars to settle the Turkish Macedonian refugees in remote parts of the empire, and that he could hardly turn out the Mohammedans who were now occupying the homes deserted by the Greek emigrants. As the best immediate remedial measure both governments agreed upon the exchange of properties between Greek and Turkish refugees. The immediate fear of a Greco-Turkish war had passed, but the question was by no means settled. To discuss the basis of an improved understanding between the two nations, M. Venizelos (the Greek premier) and the grand vizier were to have met in a semi-official conference at Brussels at the end of July, but on account of the general European crisis the meeting was called off and this somewhat forlorn hope of an amicable understanding vanished.

TURKEY AND THE WAR OF THE NATIONS. Upon the outbreak of the War of the Nations in the early days of August, Turkey ordered a mobilization of men between the ages of 20 and 45 years. For three months Turkey remained more or less neutral, but finally entered into the conflict in aid of Germany, and war was declared on November 5. The events leading up to this decision, and the operations of the war, will be found amply treated in the article on the **WAR OF THE NATIONS**.

But a few facts belong more properly to the history of Turkey. On September 10 Rustum Bey, the Turkish ambassador in Washington, announced that Turkey had decided to abrogate all conventions or Capitulations whereby the Sublime Porte had in times past restricted its own sovereignty or conferred special privileges upon foreign Powers. Starting with France in 1535, one by one the various Powers had obtained "Capitulations" or agreements from the Porte, granting to their nationals in Turkey, liberty of residence and of travel, inviolability of domicile, freedom of religion, and, to a certain extent, the right to be tried by courts of their own nationality. The abrogation of the Capitulations was therefore a most important event. It is noteworthy that the French Capitulation of 1740 was not to be modified or terminated without the consent of France. A most unpleasant indication of the spirit at Constantinople was afforded in October by the annulment of the scheme for the reform of the six Armenian vilayets. The war caused several adjustments in the cabinet. Before entering into the war Enver Pasha and his bellicose associates eliminated from the cabinet (November 2) the ministers of agriculture, of the interior, and of posts and telegraphs, who had favored peace. In December German officers were reported to have accepted the portfolios of war and of marine in the Tur-

kish cabinet, after Enver Pasha and Djemal Pasha had left for the front.

Turkey and Serbia at last concluded a treaty of peace at Constantinople on March 14, 1914, and diplomatic relations between the two countries were resumed. Extreme irritation was caused in December by the Hodeida incident. On December 11, at Hodeida in Arabia, Turkish soldiers had invaded the Italian consulate and seized the British vice-consul, G. A. Richardson, who had taken refuge there. The strenuous protests of the Italian government elicited suave apologies from the Porte, but failed to bring satisfactory reparation.

For other topics concerning Turkey, see *History* sections under CYPRUS, EGYPT, and GREAT BRITAIN; and WAR OF THE NATIONS.

TURKS AND CAICOS ISLANDS. Two groups of islands, over 30 in number, geographically part of the Bahamas, but forming a dependency of the British colony of Jamaica. Only 8 are inhabited. Total area, 169 square miles; population (1911), 5615. Grand Turk is the principal island and the government seat. The imports and exports in the 1912 trade were valued at £27,662 and £25,947 respectively. Revenue and expenditure, 1912, £8215 and £8092 respectively. There is no debt. Salt making is the only important industry, the export of salt in 1912 being valued at £18,603. The soil is low-lying and barren, and nearly all provisions for home use are imported. F. H. Watkins, appointed 1906, was Commissioner in 1914.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. An institution for the industrial and higher education of negroes, founded at Tuskegee, Ala., in 1881, by Booker T. Washington. In the autumn of 1914 there were 1527 students enrolled in all departments of the institute, and the faculty numbered 192. There were received from legacies during the year ending May 31, 1914, \$122,436. The endowment fund on the same date amounted to \$1,942,112, and the total income for the year ending May 31, 1914, was \$473,764. The library contains about 20,000 volumes. The principal is Booker T. Washington.

TWILIGHT SLEEP (DÄMMERSCHLAF). To this method of anæsthesia, or amnesia, was given great prominence in several lay journals and magazines during 1914. These productions were highly colored, exaggerated on the one hand the pains of ordinary parturition (one writer describes them as a "ahrieking horror"), and overestimated on the other hand the benefits conferred by this procedure. In addition to this, by implication, at least, they made it seem true that babies born during twilight slumber are much more vigorous mentally and physically than their brothers and sisters born under ordinary conditions. The basis on which these articles rest are the results obtained in the Freiburg Maternity Clinic, by Krönig and Gauss. The history of the method is interesting, and began some 8 or 9 years before this exploitation. Steinbüchel, of Graz, began using small doses of morphin and scopolamin with no dangerous results. His followers used repeated doses of both morphin and scopolamin, but in larger amounts, with the result that there were serious consequences, particularly the death of the infant. In 1907 a special technic was elaborated in the Freiburg clinic by Gauss. The object aimed at was to make the parturient woman for-

get her pains, although she may be conscious of them at the time. In order to test the mental condition she is shown some object, and after an interval of half an hour this object is again called to her attention. If she remembers having seen it before, she is not sufficiently amnesic and an additional dose of scopolamin is given. It is strongly emphasized that only one dose of morphin (about one-sixth of a grain) must be given, although scopolamin may be repeated. Scopolamin also has its dangers, small doses sometimes producing great disturbances of the nervous system, of the heart, and of the lungs, and it is impossible to predict these results in a given patient. The impression derived from a review of the literature was that the method is not safe for the child and not always safe and successful for the mother. This view was supported by the insistence of its most ardent advocates that the method should only be applied in hospital surroundings. It is necessary that the physician or physicians and nurses in attendance shall be with the patient from the initial pain until sometime after the child is born. Relatives are not permitted in the room. Krönig himself remarks: "The disadvantages of this method consist in the fact that with some women, especially when the surroundings are not very quiet, transitory states of confusion of mind and excitement occur. These are of no material importance, so long as the relatives of the mother do not remain in the room, for these states of excitability make an unpleasant impression on the family. In consequence of this, we carry out the method of twilight sleep only in cases where the relations promise to be out of the room during the whole time of the birth." Lequeux says: "The patient is delivered as in a delirium." Other observers find that in a large number of cases the second stage of labor is unduly prolonged and the proportion of forceps deliveries increased. The situation may be summed up by saying that the method will be successful in about 80 per cent of cases where every precaution can be taken as to surroundings, and a physician skilled in the method can be obtained. The miscellaneous application of twilight sleep is bound to result in a large number of fatalities and complications both for the mother and child.

TYPHOID FEVER. The city of Hanford, Cal., experienced an explosive outbreak of typhoid fever in 1914, which was traced to a single individual, a "carrier," a woman who prepared food for a public dinner and who never suspected that she had ever had typhoid fever. Ninety-three cases were traced to this dinner. Two of these persons had traveled over 200 miles to San Francisco, and there developed the disease, three cases traveled to Fresno, 30 miles away, before the illness seized them, and other persons were scattered in various directions from the centre of infection at Hanford, thus illustrating how a single focus may spread the disease over a wide territory. The manner in which infection took place was also interesting. After a good deal of investigation, infection was traced to a dish of spaghetti. The spaghetti was prepared at the home of the "carrier," brought to the banquet and there heated just before serving. The disconcerting fact appears to be that the dish was infected by the carrier at her home and then reheated, which process, instead of killing the bacilli, caused them to multiply. Laboratory examination showed that the dish was

swarming with bacilli and that the sauce used in making it was a good culture medium. The death-rate from typhoid fever per 100,000 population in the registration area of the United States during the year 1912, the latest report available, was 16.5, while in nearly 100,000 officers and men of the United States army, who were protected by vaccination, not a single death occurred. These statistics were quoted by Bass to show the value of the procedure.

TYRRELL, ROBERT YELVERTON. An Irish educator and literary critic, died Sept. 21, 1914. He was born at Ballingarry, County Tipperary, Ireland, in 1844, was educated at private schools and at Trinity College, Dublin, becoming a fellow at that university in 1868, professor of Latin in 1874, and professor of Greek in 1880, in which chair he served until 1898. He became senior tutor and public orator in 1899, and from 1900 to 1904 was professor of ancient history, which, with other offices, he resigned on being appointed registrar in 1904. He was one of the original Fifty Fellows of the British Academy, and in 1881 he was one of the commissioners of education in Ireland. His published writings include: *Correspondence of Cicero* (vols. i, ii, 1879 to 1886; vols. iii, iv, v, vi, and vii, with Dr. Purser, 1890 to 1900); *Latin Poetry* (1893); *Sophocles* (1897); *Essays on Greek Literature* (1909). He was also a frequent contributor to the leading English quarterlies and reviews.

UDO. See HORTICULTURE, *New Fruits*.

UGANDA PROTECTORATE. A British possession in East Africa (estimated area, 117,681 square miles, exclusive of lakes) made up of 5 provinces—Rudolf, Eastern, Northern, Western, and Buganda. The population, as estimated March 31, 1913, included 622 European males and 201 females, 3110 Asiatics, and 2,889,651 Africans. Neither area nor population can be accurately estimated, no survey having been completed and no census having been taken. Mengo is the native, Entebbe the British capital. The country is unsuited for European habitation, malaria, spirillum fever, dengue fever, and sleeping sickness being prevalent. Coffee, rubber, and cacao are among the exports. Cotton is the most important crop, the export for 1912-13 being 6313 tons, valued at £254,379; in addition, 5614 tons of cotton seed, valued at £11,335, were exported. Cattle are plentiful. Imports, exclusive of specie and bullion, but including goods in transit, were valued at £659,343 (£528,163 in 1911-12); exports, £452,310 (£384,700). Revenue, in 1912-13, £238,655 (£203,492); expenditure, £292,147 (£283,689); grant-in-aid, £45,000 (£65,000).

The so-called Uganda Railway lies entirely in the East Africa Protectorate (q.v.), where there were two short railways, the Busoga from Jinja to Namagali, and the Kampala-Port Bell Railway, which are under the control of the Uganda Railway running from Mombasa in British East Africa to Kisumu on Lake Victoria, where connection is had with a steamer service to Uganda. The King of Uganda is Baudi Chua, born Aug. 8, 1896, succeeded, 1897. Governor and Commander-in-chief, F. J. Jackson.

UNDERWOOD, OSCAR W. An American public official, elected in 1914 United States Senator from Alabama. He was born in Louisville, Ky., in 1862, was educated at the Rugby School in that city and at the University of Virginia. He studied law and in 1884 was admitted to the bar at once beginning practice in Birmingham, which city has continued to be his residence. In 1892 he was chairman of the Democratic Executive Committee of the ninth district of Alabama and was chairman of the Democratic Campaign Committee which adopted the present constitution of Alabama. In 1895 he was elected to the Fifty-fourth Congress and was reelected to successive Congresses up to and including the Sixty-third. Mr. Underwood from his first entrance into Congress was recognized as possessing rare talents as a legislator and his reputation steadily grew through successive Congresses. In the Sixty-third Congress he was chairman of the Ways and Means Committee and had in his charge the Tariff Bill passed by that Congress. His conduct of this bill through the House of Representatives greatly increased his reputation and he became recognized as the most prominent and one of the ablest members of the House. Although not a notable debater, Mr. Underwood is an effective speaker, and a profound student of economic problems. President Wilson found for the most part in Mr. Underwood a strong supporter, but he differed from the President on the Panama Tolls Bill and steadily resisted the passage of that bill in the House. (See PANAMA CANAL TOLLS.) While still engaged in his work in the House Mr. Underwood was in April, 1914, elected candidate for the United States Senate against Richmond P. Hobson. While Mr. Hobson was conducting an aggressive campaign, spending the greater portion of his time in Alabama, Mr. Underwood did not leave his duties in the House. (For details of this campaign, see ALABAMA.)

UNEMPLOYMENT. The problem of unemployment is considered by students of industrial problems as one of the most serious and probably the most difficult of solution of all problems connected with the betterment of labor. In times of depression the entire western world is impressed with the far-reaching consequences of unemployment in relation to poverty, sickness, vice, crime, and almost every social ill. Every community is also at times aware of more or less unemployment due to the seasonal changes in industry. This is especially marked in farming, railroading, millinery, and all branches of the men's and women's clothing trades. But in addition to these instances of unemployment on an extensive scale there is at all times in every industrial community a considerable amount of irregularity in employment. The United States census for 1900 (1910 not yet published) reported unemployment in that year which involved an aggregate loss in wages of nearly one billion dollars. In the winter of 1913-14 the extent of unemployment was much greater than in any year since 1907-08. The Superintendent of the Employment Bureau of the New York Association for Improving the Condition of the Poor estimated that on any given day in the win-

ter, 1913-14, there were at least 324,000 men unemployed in that city. Mayor Mitchell secured replies from 400 out of 840 private employment agencies showing that only 17 per cent of applicants were placed while 41 per cent of available places were not filled. The situation was aggravated by the presence of many floaters, raw immigrants, and other nonresidents. There resulted various demonstrations led by labor agitators, especially the invasion of various churches. (See *INDUSTRIAL WORKERS OF THE WORLD*.) A temporary free employment bureau was opened by the city.

In the fall and early winter of 1914 the extent of unemployment was even greater than a year earlier; every city had its unemployment problem. Relief agencies were overwhelmed in many places; municipal lodging houses were full to capacity, and many genuine seekers for work were sleeping on bare boards in docks, warehouses, and other accessible shelters. Many relief committees sprang into existence in November and December all over the United States; and municipal and State governments expanded public construction work as a means of partial relief.

NATIONAL CONFERENCE. The American Association for Labor Legislation held the First National Conference on Unemployment at New York City, Feb. 27 and 28, 1914. Delegates were present from 59 cities and 25 States, and the conference was opened by Mayor Mitchell. Addresses were given by university professors, social workers and officers of the Association, public officials, Socialists, Single Taxers, and labor leaders. It was manifest that statistics of unemployment were wholly lacking in the United States.

The solutions advanced included industrial and governmental measures and preventive methods; no immediate solution was advanced except by Socialist and Single Tax advocates. Unemployment insurance was prominent among relief measures advocated. The following remedies were put forward: public labor exchanges; systematization of industry, especially the dovetailing of seasonable employments; proper distribution of immigrants; vocational education; and the abolition of child labor. Every phase of the problem was considered. Substantial agreement was shown on the following points: the necessity for accurate labor statistics; the need for a widespread system of Federal labor exchanges; the urgent duty of employers to do all in their power to regularize employment; the need for industrial training and vocational guidance; and the inauguration of an effective system of unemployment insurance.

The resolutions adopted urged the establishment in the Federal Department of Labor of a Bureau of Distribution with power to establish employment exchanges throughout the country to supplement the work of State and municipal bureaus. Legislatures were urged to establish or reconstruct free nonpolitical State employment agencies controlled by the merit system and sustained by adequate appropriation and having a system of branches. Municipalities were directed to give attention to local problems of unemployment. It was recommended that private employment agencies for profit be brought under Federal or State inspection and control. The association, in cooperation with the American Section of the International Association on Un-

employment, was urged to undertake a thorough study of the labor market, labor exchanges, emergency and relief measures, the regularization of industry, casual labor, vocational guidance, and unemployment insurance.

Under the auspices of the Association the Second National Conference on Unemployment was held at Philadelphia, December 28-29. This was participated in by municipal officials, relief executives, and investigators. Public action by the city was discussed by Morris L. Cooke, director of public works, Philadelphia; action by the State by John P. Jackson, Commissioner of Labor and Industry of Pennsylvania; and action by the nation by Meyer London, Socialist Congressman-elect from New York City.

The second annual conference of the American Association of Public Employment Offices was held at Indianapolis, September 24-25. There were present 43 delegates from State employment offices and labor commissions. The lack of reliable statistics of unemployment and of the means of securing them was discussed. Attention was also paid to the plan of the United States Commission on Industrial Relations to establish a national commission of labor exchanges to cooperate with State and local public employment offices. Resolutions were passed calling for the rapid elimination of all private agencies operated for profit and requesting Federal cooperation in the distribution of labor between States. A legislative committee was appointed and also a committee charged with devising a uniform system of records and reports to be recommended for all public employment offices.

MEETING THE PROBLEM. In addition to the numerous relief committees mentioned below, the conferences above referred to, a conference of the labor commissioners of six States at Chicago, and the announcement of the Industrial Relations Commission (q.v.) that it would undertake an investigation of employment, some legislation was enacted. The most important was a law by the New York Legislature, on March 28, establishing a State system of employment exchanges. (See paragraph *Legislation*.) This followed a special message of Governor Glynn on March 6, and was the most important legislation of the year on this matter. In the early fall nine employment offices were opened in the principal cities of the State, all coordinated by a central bureau. On October 28 Mr. Charles B. Barnes was appointed director of this new employment bureau. In March Mayor Mitchell of New York City urged upon the Board of Aldermen the creation of a municipal employment bureau, and an ordinance carrying out this suggestion was adopted on April 28. In close affiliation with the American Association for Labor Legislation is the American Section of the International Association on Unemployment. These two bodies discussed means of attack upon this problem in the United States, and began the formation of committees on unemployment and relief in various States. In Chicago, Mayor Carter H. Harrison appointed an unemployment commission. This organized in seven committees dealing with the nature and extent of unemployment, methods of securing employment, effects of immigration, the dovetailing of employments, methods of relief, vagrancy and mendicancy, and the relation of vocational training and guidance to unemployment. This commission recommended the establishment of a labor exchange carefully safe-

guarded against the political spoils system. Similar committees were organized in every important industrial centre. Bills were introduced in Congress by Representatives Murdock of Kansas and McDonald of Michigan to create a National Employment Bureau. This Bureau would have branches throughout the country and would coöperate with State employment offices. The McDonald scheme called for the use of post offices as agencies.

PUBLIC EMPLOYMENT EXCHANGES. Mr. Solon de Leon made a study of the operation of public employment exchanges in the United States. He found such in 18 States and 15 municipalities. None of the Southern States were included in this list nor any of the Mountain States except Colorado. The number of offices maintained in each State was as follows: Colorado, 4; Connecticut, 5; Illinois, 6; Indiana, 5; Kansas, 1; Kentucky, 1; Maryland, 1; Massachusetts, 4; Michigan, 5; Minnesota, 3; Missouri, 3; Nebraska, 1; Ohio, 5; Oklahoma, 3; Rhode Island, 1; South Dakota, 1; West Virginia, 1; and Wisconsin, 4.

LEGISLATION. The legislation of the year included the creation of public employment bureaus in Louisiana, Maryland, and New York, and a popular referendum in Washington which had the effect of eliminating private employment agencies from that State. Louisiana authorized city councils to maintain free employment bureaus. Maryland established in its bureau of immigration an agricultural employment department. The notable law of the year was enacted in New York. This created in the Department of Labor a Bureau of Employment in charge of a director of approved executive ability and scientific knowledge. The commissioner of labor was authorized to establish branches throughout the State, in each of which he was required to appoint an advisory committee of employers and employees with a chairman agreed on by the majority. Notice of a strike or lockout may be filed with the employment office by employers or employees and this information must be conveyed to the opposite party in the dispute. Applicants must then be informed of such dispute. The officers may organize subdivisions for men, women, and children. Applicants between the ages of 14 and 18 may register at school on special forms which will then be transmitted to the employment office. Each advisory committee must appoint a subcommittee on juvenile employment. Coöperation of the branches including an exchange of lists of vacancies is required; and the Commissioner is authorized to expend 5 per cent of the employment bureau's appropriation in soliciting business. The publication of a bulletin giving information regarding the state of the labor market is required.

GREAT BRITAIN. Beginning in 1910 Great Britain adopted a policy of establishing an extensive system of public employment offices. These are headed by a central office at London, and 8 divisional offices at London, Bristol, Birmingham, Doncaster, Warrington, Cardiff, Glasgow, and Dublin, which supervise 423 labor exchanges that are connected with 1066 local agencies. The aim has been to place an agency within five miles of every considerable body of workers. These offices employ a total of about 5000 clerks and supervisors, and have proved a most valuable aid in the distribution of surplus labor.

UNEMPLOYMENT INSURANCE. An analysis of the present status of unemployment insurance shows that all schemes may be classified under three general headings, namely, (1) public subsidies to the unemployment insurance funds of trade unions; (2) State or communal voluntary unemployment funds; and (3) compulsory insurance. The first of these systems is practiced extensively in Germany, Belgium, Holland, France, Luxemburg, and Switzerland without State regulation. The same principle, but with legal regulation for the entire country, is found in Norway, Denmark, and Great Britain. The last country has introduced compulsory insurance for the building and allied trades including about 2,500,000 workmen. The system of subsidizing workmen's unions is known as the Ghent system. It has been extensively practiced because it imposes light financial burdens upon the State or city and is easy of introduction; but it is not believed by students of the problem to be an effective solution for this far-reaching industrial evil. The voluntary employment funds to which any workingman of the city is entitled to contribute and from which he may draw benefits after meeting certain conditions have been best administered in Berne, the Canton of Basel, and the city of Cologne. A combination of the subsidy of voluntary unemployment funds has been tried in Bavaria and Württemberg. These funds have not succeeded in meeting the situation because a relatively small proportion of those who ought to be protected by unemployment insurance will voluntarily make the sacrifices necessary to pay their premiums. Aside from a short experiment in the city of St. Gall and the recent introduction of the idea in the watch and clock industry in the Swiss Canton of Nuremberg, and the English case above noted, compulsory unemployment insurance has not been tried.

In Norway 400,000 wage earners, and in Denmark 500,000 wage earners are insured under voluntary schemes. In France, on the other hand, fewer than 50,000 workmen, in Belgium only slightly more than 100,000, and in Holland only 30,000 workmen have any kind of unemployment insurance. The proportions for numerous cities practicing unemployment insurance vary through similar extremes. While, therefore, insurance against unemployment is being extensively practiced in Europe, yet the vast majority even of European workmen are still uninsured.

Great Britain. The National Insurance Act passed December, 1911, and effective July 15, 1912, contained provisions for compulsory insurance against unemployment of workers engaged in engineering trades, shipbuilding, building, and construction of vehicles. The law provided for a total premium of 6½ pence per worker insured, to be made up by employer and employee paying 2½ pence each, to which the State added 1½ pence, or one-third their total. The employer was made responsible for payment for himself and workers. The law provided also that a trade union or voluntary association of workers may insure themselves under the act and the government would refund one-sixth of their unemployment benefits. Registration was begun July 15, 1912, and the first premiums were paid Jan. 15, 1913. By Jan. 1, 1914, there were 2,508,939 persons insured under compulsory sections, including about 100,000 boys and 10,000 women and children. Under the voluntary plan,

172 unions with 378,041 members were insured. The total was, therefore, nearly one-fifth of all workers in Great Britain and Ireland. Nevertheless the act is not considered by any means a final solution of the unemployment evils of low paid casual labor or of the extensive unemployment among young persons. The benefits paid during the first 6 months were £236,458. The total funds collected in 1913-14 were £2,300,000, of which the State subsidy equaled £600,000. The balance in the fund was £1,600,000. The administration expenses have been about 10 per cent of the total outlay.

UNEMPLOYMENT INSURANCE. See **UNEMPLOYMENT.**

UNION COLLEGE. An institution for higher education, founded at Schenectady, N. Y., in 1795. The enrollment in all departments in the autumn of 1914 was 474, the faculty numbered 38, and was increased during the year. There were no noteworthy benefactions received. The productive funds of the college amount to about \$950,000, and the income from all sources to about \$115,000 annually. The library contains about 43,000 volumes. The president is Rev. C. A. Richmond, D.D.

UNITARIANS. The latest available statistics for this denomination are for 1906, at which time there were 70,542 communicants, 477 churches, and 531 ministers. The administrative body is the American Unitarian Association which has headquarters in Boston. The denomination is active in distributing literature and in organizing conferences for the promulgation of Unitarian thought. The social work is carried on by the Department of Social and Public Service, created in 1908. This department conducts a Bureau of Council and Information, promotes lecture courses in the churches, and has also organized a lending library, but its most notable work has been the publication of a series of pamphlets on various social service topics, which are a distinct contribution to the literature of the question. The Unitarian Fellowship for Social Justice is an unofficial organization which urges the denomination in the direction of the Christian reconstruction of the social order. Divinity schools of the church are maintained at Cambridge, Mass., Meadville, Pa., and Berkeley, Cal. Missionary work is carried on at many points among Icelandic, Norwegian, and Swedish immigrants of the United States. Among the publications are the *Christian Register*, published in Boston; the *Unitarian Advance*, published in New York; and the *Pacific Unitarian*, published in San Francisco. The president of the American Unitarian Association is Rev. Samuel A. Eliot, and the secretary is Rev. Lewis G. Wilson.

UNITED BRETHREN. See **MORAVIANS.**

UNITED KINGDOM. See **GREAT BRITAIN.**

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA. This denomination was founded in 1853 by a union of associate and associate reformed churches. For several years negotiations leading to a union of this denomination with the Presbyterian Church in the United States have been under way. The denomination in 1914 included 148,220 communicants, 1126 churches, and 1167 ministers. There are 13 synods and 72 presbyteries. Missions are maintained in India, Egypt, and the Sudan.

UNITED STATES. POPULATION. The esti-

mated population of the United States on July 1, 1914, was 109,201,992. Of continental United States the estimated population on the same date was 98,781,324, compared with a population of 91,972,266 on April 15, 1910. The population of the several States and territorial possessions will be found in the articles dealing with them.

AGRICULTURE. General statistics for agriculture in 1914 for the United States and its dependencies will be found in the articles dealing with agriculture and agricultural products. The section *Agriculture* in each State article gives the acreage, production, and value of the principal crops. For foreign agricultural statistics, see the agricultural sections under the various countries. See also the articles **AGRICULTURE**; **AGRICULTURAL EDUCATION**; **HORTICULTURE**; **IRRIGATION**; etc.

MANUFACTURES. Manufacturing statistics for 1914 will be found in the articles dealing with the chief industries as **COTTON**, **TEXTILE MANUFACTURING**, **STOCK RAISING**, **WOOL**, etc.

MINERAL PRODUCTION. The general article **MINERAL PRODUCTION IN THE UNITED STATES** gives the production of all metals and minerals in 1913. Under each State will be found a section giving the mineral production of that State in 1913, and in 1914 when possible. For the mineral production of foreign countries, see sections under those countries. See also the articles on the various minerals.

EDUCATION. For information in regard to educational matters in 1913, see the article **EDUCATION IN THE UNITED STATES**, and for notes on higher and professional education, see **UNIVERSITIES AND COLLEGES**. In the article on each State and Territory will be found a paragraph dealing with educational statistics.

RELIGION. For information regarding the year's history of the various religious denominations, see the articles on the respective denominations. General information relating to religious bodies in 1914 will be found in the article **RELIGIOUS DENOMINATIONS AND MOVEMENTS**.

FOREIGN COMMERCE. Statistical tables relating to the foreign commerce of the United States in 1914 are given on pages 717-719. Table I is a summary for the calendar year, giving in detail by countries the total imports and exports in 1913-14. Table II is a general summary of the foreign commerce for the fiscal years 1913-14. Tables III and IV give, respectively, the chief articles of import and export for the calendar years 1913-14.

Commerce and the War. The effects of the war on international commerce, when viewed as a whole by the returns for the calendar year, do not appear to have been as serious as they really were. Thus the total imports from all countries for the calendar year 1914 were hardly less than in 1913. The figures for the former year are \$1,789,276,001, while for the calendar year 1913 they were \$1,792,596,480. The difference in the exports for the corresponding periods of the two years, although greater, does not as a whole show an alarming situation. The total for 1914 was \$2,113,624,050, while the total for 1913 was \$2,484,018,292. A more striking presentment of the effects of the war on commerce will be found by making a comparison of the imports and exports for June and December in 1913 and 1914, that is, for the last month of the fiscal and calendar years. The figures for

June show a normal condition, while those for December, 1914, show effects of the war on American commerce. In June, 1914, the imports totaled \$157,529,450, but in December, 1914, they had fallen to \$114,656,545. The comparison between December, 1913, and December, 1914, shows even greater difference, as in December, 1913, the imports amounted to \$184,025,571. A comparison of the export trade for June, 1914, and December, 1914, shows a great increase in the latter month. In June, 1914, the exports amounted to \$157,072,044, while in December, they had reached a total of \$245,632,558. In December, 1913, the exports were \$233,195,628. From these figures it appears that while the import trade suffered considerable decline on account of the war, the export trade, due to the demand for products in belligerent countries, showed a great increase.

Of still greater interest is a comparison of trade with Europe in these respective periods. The total imports from European countries in the calendar year 1914 amounted to \$783,517,509, compared with \$864,666,103 in the calendar year 1913, a decrease of over \$75,000,000. The total imports from European countries for the fiscal year 1914 was \$894,602,868, which was practically the same as that for the fiscal year 1913. Exports to European countries in the calendar year 1914 amounted to \$1,339,295,916, compared with \$1,549,573,363 for the calendar year 1913, a loss of over \$160,000,000. Again we make the comparison between the months of June and December. In June, 1914, the total imports from European countries was \$69,100,120, while in December they had fallen to \$44,955,265. The exports in June, 1914, to European countries amounted to \$90,310,794, while in December, 1914, they had increased to \$190,201,330. The exports in December, 1913, amounted to \$156,668,211, and in June, 1913, to \$82,088,799.

It will be interesting to note the effect of commerce conditions in the countries at war in relation with the United States. Taking them in their alphabetical order, we find that imports from Austria-Hungary in December, 1913, amounted to \$1,977,836; in December, 1914, they were \$1,226,194. The exports in December, 1913, to Austria-Hungary, amounted to \$3,162,652, while in December, 1914, they had fallen to \$2700. The imports from Belgium in December, 1913, amounted to \$3,043,076; in December, 1914, they had fallen to \$396,676. The exports to Belgium in December, 1913, amounted to \$7,740,512, but they had fallen in December, 1914, to \$758,282. The imports from France in December, 1913, amounted to \$17,553,751; in December, 1914, they had fallen to \$6,025,647. The exports in December, 1913, were \$18,341,017; they had risen in December, 1914, to \$37,585,679. The imports from Germany in December, 1913, amounted to \$18,272,085; in December, 1914, they had fallen to \$8,680,428. The exports in December, 1913, were \$33,210,285, and in December, 1914, these had fallen to \$2,194,035. The imports from Russia in December, 1913, were \$2,512,754; in December, 1914, \$7448. The exports to Russia in December, 1913, were \$4,971,120; in December, 1914, \$479,429. The imports from the United Kingdom in December, 1913, were \$28,597,188; in December, 1914, they had fallen to \$14,937,749. The exports to the United Kingdom in December, 1913, were \$61,-

092,740; in December, 1914, they had risen to \$83,863,254.

It is interesting also to consider the effect of the war on the commerce between neutral European countries and the United States, in which it will be found that for the most part there has been a great increase. In the calendar year 1913 the imports from Denmark totaled \$2,466,910, and in 1914, they were \$3,844,827. The exports to Denmark in the calendar year 1913 amounted to \$18,617,058, and they had risen to \$41,945,344 in the calendar year 1914. The imports from Italy were practically unchanged in the two years, but exports showed a great increase in 1914. In 1913 there were exported to Italy goods to the value of \$78,675,043, and this increased in 1914 to \$97,932,200. The Netherlands, contrary to conditions in other countries, showed a decrease in exports, while imports remained practically the same. While the exports to the Netherlands from the United States in 1913 amounted to \$121,552,038, they had fallen in 1914 to \$100,743,803. Imports from Sweden were practically the same in the two years, but exports increased from \$13,586,596 to \$30,961,285 in 1914.

An examination of the exports of certain commodities for the calendar year will give interesting results as shown in the tables III and IV below. More instructive, however, is a comparison of figures for the last month of the year. The total export of foodstuffs in December, 1914, was \$55,860,209, compared with \$11,149,600 in December, 1913. Wheat exports in December, 1914, aggregated 28,875,217 bushels, compared with 5,724,027 bushels in December, 1913. Corn exports in December, 1914, amounted to \$4,582,006, compared with \$749,124 in December, 1913. Fresh beef in December showed a total export of 6,594,348 pounds, compared with 524,430 pounds in December, 1913. Pickled and salted beef doubled in quantity of export. Cotton was one of the products most discussed in relation to export trade. In December, 1914, there were exported 1,202,115 bales of cotton, valued at \$49,340,720, compared with 1,230,830 bales, valued at \$81,953,499 in December, 1913. The exports of cotton for the calendar year show an even greater falling off, as in the calendar year 1913 there were exported 8,609,588 bales, valued at \$575,488,090, compared with 6,320,485 bales, valued at \$343,904,905 in 1914.

Of rather gruesome interest is the comparison of the exports of explosives, including cartridges, dynamite, gunpowder, etc. In December, 1914, these commodities were exported to the value of \$2,170,387, compared with a value in December, 1913, of \$885,658, the total exports of explosives for the calendar year 1914 being \$10,037,567, compared with \$5,525,077 in the calendar year 1913. Copper was declared conditional contraband and the restrictions are reflected in the exports for the year, as in December, 1913, copper was exported to the value of \$12,666,621, while in December, 1914, it had fallen to \$7,073,182, and for the calendar year 1914 the total exports of copper were \$117,188,350, compared with \$144,909,117 in 1913. Iron and steel manufactures also showed a marked falling off, as in 1913 the total value of these exported was \$294,435,060, while in 1914 they had fallen to \$199,861,684, or a decrease of nearly \$100,000,000. The imports of iron and steel for the calendar year 1914 were \$28,615,344, com-

pared with a value of \$33,601,985 in 1913. For a comparison of the exports and imports of other commodities for the years 1913-14 consult tables III and IV.

In general the commerce from the grand divisions, excluding Europe, showed comparatively little change as regards imports, but quite material decreases of exports. The import trade from North America increased from \$389,814,744 in 1913 to \$441,400,758 in 1914. With South America there was an increase from \$198,259,005 in 1913 to \$229,520,375 in 1914. The import trade with Asia and Oceania was practically the same, while that with Africa showed a falling off of about \$3,000,000. The export trade with North America countries showed a decrease from \$601,176,159 in 1913 to \$481,588,221 in 1914. The South American trade fell off from \$146,514,635 in 1913 to \$91,013,339 in 1914. The export trade with Asia and Oceania suffered a decrease from \$207,825,327 in 1913 to \$176,402,751 in 1914. The African trade showed a decrease of about \$3,000,000 in 1914.

Commerce with Noncontiguous Possessions. The exports from the United States to Alaska in the calendar year 1914 were valued at \$21,

100,775, compared with a value of \$21,097,040 in 1913, and the imports from Alaska in the same period amounted to \$24,255,189, compared with \$21,601,413 in 1913. The exports to Hawaii in the calendar year amounted to \$21,473,230 and the imports from Hawaii to \$47,086,271 in 1914, compared with \$40,143,953 in 1913. To Porto Rico were sent in 1914 goods valued at \$29,927,274, compared with \$32,866,652 in 1913, and there were received from that island goods valued at \$35,163,781, compared with a value of \$39,637,332 in 1913. Exports to the Philippines in 1914 were valued at \$22,797,400, compared with a value of \$27,904,727 in 1913, and products were received from the islands valued at \$23,611,809 in 1914, compared with a value of \$17,913,173 in 1913.

Imports and Exports of Gold and Silver. The total imports of gold in ore, bullion, and coin in the calendar year 1914 amounted to \$57,387,741, and the exports of gold amounted to \$222,616,156, leaving an excess of exports of \$165,228,415. The imports of silver in ore, bullion, and coin for the calendar year were valued at \$25,959,187 and the exports to \$51,603,060, leaving an excess of exports of \$25,643,873.

TABLE I
FOREIGN COMMERCE BY COUNTRIES IN THE CALENDAR YEARS 1913 AND 1914

Countries	Imports		Exports	
	1913 Dollars	1914 Dollars	1913 Dollars	1914 Dollars
Europe:				
Austria-Hungary	19,083,392	15,683,880	22,244,599	12,801,195
Belgium	41,458,376	30,862,019	64,317,469	84,771,028
Denmark	2,466,910	3,844,827	18,617,058	41,945,844
France	188,933,883	104,215,131	158,922,526	170,104,041

NATIONAL DEBT. The amount and classification of the United States national debt at the end of the calendar years 1912, 1913, and 1914 were as follows:

	Dec. 31, 1912	Dec. 31, 1913	Dec. 31, 1914
Interest-bearing debt at from 2 to 4 per cent and redeemable from 1908 to 1961, inclusive	\$ 964,631,680.00		
Debt on which interest has ceased since maturity	1,695,070.26		
Debt bearing no interest	874,733,081.90		
Gross debt	1,841,059,782.16		
Cash balance in general fund	143,576,381.22		
Net debt	\$1,197,483,400.94		
Interest bearing debt	\$ 966,823,490.00	\$ 968,825,550.00	
Debt on which interest has ceased	1,641,720.26	1,518,670.26	
Debt bearing no interest	870,797,255.40	868,778,399.40	
Aggregate	1,839,262,465.66	1,839,122,619.66	
Certificates and Treasury notes	1,607,771,969.00	1,450,584,869.00	
Gross debt	2,947,034,434.66	2,789,707,488.66	
Cash in Treasury:			
Currency trust funds	1,607,711,969.00	1,450,584,869.00	
Gold reserve fund	150,000,000.00	151,988,820.11	
Net balance, general fund	111,854,317.93	66,770,674.65	
National Bank notes, re- demption fund (in- cluded in public debt under re- quirement of act of Con- gress, July 14, 1890)..	17,209,266.00	15,192,433.00	
Total	\$1,886,835,552.93	\$1,684,536,796.76	
Net debt ...	\$31,060,193,881.73	\$1,115,170,691.90	

The receipts and disbursements for the fiscal year ending June 30, 1915, are estimated by the Secretary of the Treasury in his annual reports as follows:

Receipts		
Customs	\$270,000,000	\$220,000,000
Internal revenue	512,000,000	359,000,000
Corporation and income taxes	95,000,000	80,000,000
Miscellaneous	59,000,000	69,000,000
Total ordinary receipts ..	\$786,000,000	\$728,000,000

<i>Disbursements</i>		
Civil establishment	\$177,000,000	\$189,000,000
War Department	170,000,000	168,000,000
Navy Department	138,000,000	140,000,000
Indian service	21,000,000	21,000,000
Pensions	175,000,000	169,000,000
Interest on the public debt ..	22,900,000	23,000,000
Total ordinary disbursements	\$701,900,000	\$710,000,000
Surplus for 1915 in ordinary receipts	\$ 34,100,000	\$ 18,000,000
Panama Canal disbursements	41,000,000	28,000,000
Miscellaneous redemptions of the public debt		
Total estimated deficit...	\$ 6,900,000	\$ 10,000,000

COINAGE. The coinage executed at the mints of the United States during the calendar year 1914 was as follows:

COINAGE EXECUTED AT THE MINTS OF THE UNITED STATES DURING THE CALENDAR YEAR 1914

<i>Denomination</i>	<i>Pieces</i>	<i>Value</i>
Double eagles	2,046,320	\$40,926,400.00
Eagles	702,550	7,025,500.00
Half eagles	757,125	3,785,625.00
Quarter eagles	688,117	1,720,292.50

Total coinage	154,350,157	\$61,749,711.72
Coinage executed for Philippine Islands' Government, 6,975,500 pieces.		
Coinage executed for the following foreign governments:		
San Salvador, 7,000,080 (5c and 10c silver pieces).		
Costa Rica, 859,425 (50c, 10c and 5c silver pieces).		
Ecuador, 2,500,000 pieces.		

The circulation statement, given in the accompanying table so entitled, is from figures compiled by the Treasury Department, and published Jan. 2, 1915.

ARMY. The regular army of the United States on June 30, 1914, consisted of 4701 officers and 87,781 men. In the latter total are included the quartermaster corps of 3809 men and the hospital corps of 4055. Of the total number, 758 officers and 17,901 men belong to the Coast Artillery, and are therefore practically stationary in coast defenses; 1008 officers and 18,434 men belong to the staff, technical, and non-combatant branches of the army, including recruits and men engaged in recruiting. Deducting these, the mobile army, so-called, was composed of 2935 officers and 51,446 men. On the date mentioned the troops were disposed of approximately as follows: In the Philippines, 3½ regiments of infantry, 2 regiments of cavalry, 1 regiment of field artillery, 2 companies of engineers, and 11 companies of coast artillery, aggregating in strength 9572. In the Hawaiian Islands were 3 regiments of infantry, 1 regiment of cavalry, 1 regiment of field artillery, 1 company of engineers, 8 companies of coast artillery, an aggregate strength of 8195. In the Canal Zone were 1 regiment of infantry and 3 companies of coast artillery, aggregating 2179. There were in China 2 battalions of infantry with a strength of 849, and in Alaska 1 regiment of infantry, numbering 862. There were in Vera Cruz 4 regiments of infantry, 2 troops of cavalry, 1 battalion of field artillery, and 1 company of engineers, an aggregate strength of 4090. In Porto Rico was a 2-battalion regiment of infantry, with a strength of 707. There were in the United States 17 regiments of infantry, 11½ regiments of cavalry, 3½ regiments of field artillery, an aggregate strength of 64,579. Troops in Vera Cruz were later in the year removed to the United States. Practically all the organizations in the United States proper are on what is known as a peace footing, which means that an infantry company, which upon a war footing should have 150 men, has 65 men; a cavalry troop, which upon a war footing should have 100 men, has 71 men; and an artillery battery, which upon a war footing should have 190 men, has 133 men. The coast art-

Population of continental United States January 2, 1915, estimated at 99,875,000; circulation per capita, \$35.50.

a This statement of money held in the Treasury as assets of the government does not include deposits of public money in National Bank Depositories to the credit of the Treasurer of the United States, amounting to \$69,681,330.62. For a full statement of assets see Public Debt statement.

b For redemption of outstanding certificates an exact equivalent in amount of the appropriate kinds of money is held in the Treasury, and is not included in the account of money held as assets of the government.

c Includes additional circulating notes issued under authority of act of May 30, 1908, as amended by acts of December 23, 1913, and August 4, 1914.

d Amount issued Federal Reserve banks.

e Includes \$11,952,300 in hands Federal Reserve agents for retirement Federal Reserve notes.

f Includes \$300,000 in hands Federal Reserve agents for retirement Federal Reserve notes.

lery companies are always kept on a war footing of 104 men each.

During 1914 a large part of the army was occupied in actual field service at Galveston, Vera Cruz, the Mexican border, and in Colorado and Arkansas. See MEXICO; STRIKES.

In the last months of the year, largely as a reflection of conditions resulting from the war in Europe, there was a very general discussion as to the condition of the national defenses of the country. In Congress, Representative Gardner, of Massachusetts, introduced a resolution in December calling for a Congressional inquiry as to the condition of our defenses. A similar resolution was introduced in the Senate by Senator Lodge. The statements of Mr. Gardner and others as to the alleged inadequacy of the defenses and the unpreparedness of the military and naval forces, were the subject of many addresses and public meetings. At a meeting of prominent men in New York City a committee of 50 was appointed, and an organization, known as the National Security League, was formed to support the Gardner resolution and seek to promote an understanding of the conditions to which it relates. The House Committee on Rules refused a hearing on the Gardner resolution by a party vote of 5 to 3. It became known that President Wilson opposed the methods suggested by Mr. Gardner because he considered it an unwise way of handling questions which might create very unfortunate international impressions, but he declared that he was in favor of the fullest inquiry by the regular committees of Congress. Before these committees appeared many prominent army officers. That the question of the adequacy of the national defenses is a very important and real one was shown by the detailed treatment given to the subject by Secretary Garrison in his annual report, where, unlike President Wilson, Mr. Garrison treats the question as a very serious and pressing one. He points out that there were on hand at the time of the writing of his report a sufficient amount of small-arm ammunition and equipment, roughly speaking, to equip 500,000 men, the least number that would have to be called into the field in any large emergency. He states that there is nothing like a sufficient supply of artillery and artillery ammunition, and declares that it is imperative that the manufacture of artillery and ammunition should progress as rapidly as possible until a proper reserve has been obtained. Mr. Garrison does not advocate a large increase in the standing army. He would, however, increase the enlisted personnel by 25,000 men, which should bring up to full strength the existing units of the mobile army in the continental United States and thus supply a more adequate force. This increase would also afford training for the officers in command of such units as they must command in time of war and would prevent, as far as the regular army is concerned, the crowding of the ranks with raw levies which always disorganize and render inefficient the organizations into which they come. Still more important he considers the preparation of a reserve, and he declares that the present legislation with respect to such a reserve has proven utterly useless for the purpose, as in 24 months it produced only 16 men. The standing army, in his opinion, should be used as a school through which to pass men who come into it, with the knowledge that

if they are proficient they can be discharged at any time after a year or 18 months.

There was a very marked decrease in the percentage of desertions in the regular army during the year.

NAVY. The enlisted men in the navy on June 30, 1914, numbered 52,667, or 4612 more than in 1913. For the first time in many years the enlistment was up to the limit prescribed by Congress.

The appropriations for the fiscal year 1914-15 for the naval establishment amounted to \$140,233,716, exclusive of \$4,635,000 appropriated from the proceeds of the sale of the battleships *Idaho* and *Mississippi* to Greece. Estimates submitted for the naval establishment for the fiscal year 1915-16 amount to \$139,569,409, or \$664,306 less than the appropriations for 1915. The building programme recommended by the Navy Department included 2 dreadnoughts, 6 destroyers, 8 submarines or more (1 to be of sea-going and 7 or more of coast-defense type), 1 gunboat, and 1 oiler. The General Board of the Navy made recommendations which provided for a much greater increase than the request of the Navy Department. This board recommended for the 1916 programme, 4 battleships, 16 destroyers, 3 fleet submarines, 16 coast submarines, 4 scouts, 4 gunboats, 2 oil-fuel ships, 1 destroyer tender, 1 submarine tender, 1 navy transport, 1 hospital ship, and 1 supply ship. In its report accompanying this recommendation the board points out that in November, 1914, there were 30 effective battleships, complete and ready for service less than 20 years old; there were 4 battleships under construction, 2 authorized in 1914, and 1 battleship to replace the *Idaho* and *Mississippi*,—making a total of 37 battleships either completed or provided for. According to the programme adopted by the board in 1903 providing for 2 battleships per year, the navy is now deficient 10 battleships, built, building, or authorized. The adoption of the recommendations made by the board for 1916 would bring up the number of battleships necessary to follow out the 2 battleships a year programme adopted in 1903. While in general the report of Secretary Daniels is optimistic as regards present and future conditions of the navy, that of the General Board indicates that that body considers the present situation leaves much to be desired in the way of preparedness and equipment.

During the fiscal year 1914 the effective force of the navy was increased by the completion of 2 battleships, the *Texas* and the *New York*; 8 torpedo boat destroyers; 10 submarine torpedo boats; 2 fuel ships; and 3 gunboats. The *Texas* and the *New York* were the first vessels to be armed with 14-inch guns, and they have a speed in excess of 21 knots. The three battleships authorized by the preceding session of Congress will carry a secondary battery so arranged as to be available for coast-defense against torpedo boat destroyers irrespective of any condition of weather. These battleships, to be named *California*, *Idaho*, and *Mississippi*, have been assigned and they will be known as the *California* class. The *California* will be constructed at the navy yard in New York and the other battleships at private yards. As noted above, the battleships *Idaho* and *Mississippi*, which had been largely outgrown, were sold to the government of Greece for \$5,827,410, the sum thus obtained to be employed in the construction of one bat-

tleship. A recommendation made nearly every year for the creation of the rank of an admiral and vice admiral in the navy was again placed before Congress in 1914, and though it met with practically no serious opposition, no action had been taken at the end of the year. The navy saw active service in Mexico, in April, when 19 men were killed during the attack on Vera Cruz. The work of the marine corps was especially efficient. See MEXICO.

The discussion as to national unpreparedness, which is noted in the section given above, included also the navy. Several high naval officers testified before the House committees, and the evidence showed a disturbing condition in the preparedness of the navy for active service should the occasion arise. This feeling, as suggested above, was not shared by Secretary Daniels.

On April 5 Secretary Daniels issued an order forbidding the use of alcoholic liquors in the navy. For notes in regard to the relative strength of the United States navy, in comparison with foreign navies, see the article NAVAL PROGRESS.

POST OFFICE. The operations of the Post Office Department for the fiscal year 1914 showed a surplus amounting to approximately \$3,600,000. The postal revenue for the fiscal year amounted to \$287,934,565, an increase over the preceding year of slightly less than 8 per cent, and the expenditures amounted to \$283,543,769.

Parcel Post. The most notable feature of the postal service during the year was the growth and development of the parcel post. There is reason to believe that the postal service has handled during the year more than 800,000,000 parcels. Statistics covering the first fifteen days of October, 1914, show a material increase over the number of parcels handled in April of the same year, notwithstanding the depressing effect of the European War. The original expectation of the advocates of the parcel post were that possibly 300,000,000 parcels would be handled during the first year. This increased volume of business has imposed upon the postal service many difficult problems in connection with the transportation and handling of mail, and has necessitated many improvements of equipment and changes in the method of handling parcels. These have been successfully made, expediting parcel business without delaying other mail. On July 1, 1913, the insurance fee on parcels was reduced from 10 cents to 5 cents. This action greatly stimulated the ordinary parcel traffic as well as the insured business and has met an important public need. During the fiscal year more than 13,000,000 parcels were insured, or more than twice the number sent by registered mail before the establishment of the parcel post.

On March 16, 1914, an order was issued changing the classification of books from third to fourth class, thus permitting books to be sent through the parcel post. Congress also passed a law permitting the shipment of seeds, bulbs, etc., by parcel post.

Railway Mail Service. The development of the railway post-office terminal system continued, and its operation rendered unnecessary large expenditures for railway post-office cars and railway clerks which would otherwise have been required. At certain post offices experiments with government-owned automobiles are being carried on.

The officers of the department continued their inquiry into a general question of a proper basis for fixing compensation for the transportation of the mails by railroads. A bill was introduced into the House providing for an adjustment of rates, but no action had been taken at the end of the year.

Foreign Mail Service. The volume of mail sent to foreign countries during the fiscal year 1914 increased materially over that dispatched during the previous year. On May 9, 1914, a parcel post service with Greece was inaugurated and a convention was concluded with the Republic of Liberia, effective July 1, 1914. Modifications were made in the parcel post conventions with the Bahamas, Barbados, British Honduras, Ecuador, Jamaica, and the Leeward Islands. During the year negotiations were in progress for conventions with Cuba, Argentina, China, Gibraltar, Portugal, Russia, Spain, and Switzerland.

Aerial Mail Service. During the fiscal year 1914 permission was given in eight instances authorizing experimental aerial mail service. In view of the importance of developing this method of transportation, an item was included in the 1916 estimates for \$50,000 to provide for an experimental service, as it is believed that there are sections of the country where, because of topographical conditions, this service might be advantageously employed.

Postal Savings System. There was a steady and substantial growth in this system during the year. On June 30, 1914, the number of depositors was 388,511, and the amount on deposit was \$43,444,271, a gain for the year of 57,505 depositors and \$9,625,401 in deposits. The average principal per depositor increased from \$102 to \$111.82. Savings facilities were available at 9639 post offices, of which 8507 were of the presidential grade and 1132 fourth class, and at 708 branches and stations, making a total of 10,347 depositories in operation.

Rural Mail Service. This service was extended during the year to considerably more than 500,000 people, and nearly 900 rural routes, with an aggregate length of over 20,000 miles, were established. Additional demands upon the service for the transmission of farm products and a larger bulk of merchandise through the mails were met. There were over 23,000,000 patrons of the service in 1914.

PENSIONS. The total expenditure for pensions in 1914 was \$172,417,546. From 1866 to 1913 there were paid out \$4,461,094,380, making a total on June 30, 1914, of \$4,633,511,926. There were on the pension roll at the beginning of the year 785,239 pensioners. The loss by death during the year was 33,639. During a rearrangement of the Revolutionary War archives the number of pensioners of the Revolution was counted and the total was found to be 72,284.

The number of cases considered by the Board of Review, during the fiscal year 1914, was 169,973, and of this number there were allowed 94,325. During the year there were issued 95,606 certificates. There were 369,624 survivors of the Civil War, 24,250 survivors of the Spanish War, and 170 widows of pensioners of the War of 1812 receiving pensions at the close of the fiscal year. There were 893 survivors of the War with Mexico, and 4699 widows of pensioners of that war, as well as 915 survivors of the Indian wars, and 2182 widows. In the regular army there

were 14,919 invalids and 2892 widows receiving pensions.

BUREAU OF MINES. The Bureau of Mines carried on many interesting and important experiments during the year. Methods for extracting radium from the carnotite ores of Colorado and Utah were invented and applied. These resulted in greater efficiency than is attained by any foreign producer of radium at an indicated cost of less than one-third of the present selling price. The Bureau also developed the fact that the annual value of the by-products wasted in present methods of making coke in the United States amounts to \$75,000,000. Investigations were carried on looking to the use of better methods of making coke and the upbuilding of by-product industries. Through an expenditure of not more than \$15,000 in investigations and demonstrations, the Bureau was instrumental in saving natural gas valued at \$15,000,000 during a period of 18 months. Investigations and experiments with a view of increasing efficiency in the petroleum industry were conducted. It is estimated that the preventable wastes and losses in the development of oil fields and in transporting and storing oil amount to fully \$50,000,000 yearly. There were designed and demonstrated devices for arresting dust explosion in mines. Through the work of the Bureau many men were rescued after disasters, and over 8000 miners were trained in rescue or first-aid methods. The Bureau has been instrumental in greatly increasing the number of rescue and first-aid corps equipped and maintained by mining companies. Nearly 25,000 miners have received this training and more than 12,000 sets of rescue apparatus have been purchased by private companies.

DIPLOMATIC SERVICE. The outbreak of the war in Europe in August, 1914, brought to the ambassadors, ministers, and consular officers of the United States in the countries at war or affected by the war, serious duties, which were almost without exception admirably performed. The burdens fell with a special severity upon the embassies in London, Paris, and Berlin, and upon the American minister in Belgium. In London, Ambassador Page was confronted with a very serious situation resulting from the desire of thousands of Americans, who were in Europe at the time of the outbreak of hostilities, to reach their homes. To this were added financial difficulties which resulted from a temporary suspension of the use of credits and paper money. In Paris, Ambassador Herrick was retained after the outbreak of the war because of the remarkably efficient work which he had done toward improving the very serious conditions which confronted Americans and other foreigners in Paris. On June 12 the President appointed William G. Sharp ambassador to France, and he proceeded to Paris and willingly furnished efficient aid to Mr. Herrick. The latter returned to the United States in the latter part of the year and Mr. Sharp assumed the duties of the office. In Berlin, Ambassador Gerard was entrusted not only

with affairs relating to American citizens, but took charge also of the diplomatic business of Germany and Great Britain on the retirement of the ambassadors of those nations following the declaration of war. His position was an extremely delicate one, but he fulfilled the duties in a manner which won the praise of the officials and public of all the European nations. Brand Whitlock, United States minister in Belgium, had perhaps the hardest tasks of any of the diplomatic representatives of the United States. He had general charge of the distribution of relief in Belgium, and labored ceaselessly to better the condition of the unfortunate citizens of that country.

The embassy to Russia was filled for the first six months of the year by Curtis Guild, of Massachusetts, appointed by President Taft. Henry M. Pindell, of Illinois, was in 1913 nominated by President Wilson to fill the post. The appointment was severely criticised as being in a large measure a reward for political activities, and it was alleged that Mr. Pindell had few of the qualifications for filling such an office and that he had been appointed largely as a result of political favors done to Mr. Bryan. Nevertheless, the Senate confirmed his appointment on January 26 and on the following day Mr. Pindell sent his resignation to President Wilson with the statement that he did not wish to embarrass the latter's administration by accepting the post. On July 1, George T. Marye, of California, was appointed ambassador to Russia. As noted above, William G. Sharp was appointed ambassador to France in June. During the year, bills were passed in Congress raising the rank of the diplomatic posts in Argentina and Chile to embassies. Frederick J. Stimson, of Massachusetts, was appointed first ambassador to Argentina, and Henry P. Fletcher, of Pennsylvania, who had previously held the post of minister to that country, became ambassador to Chile. On March 31, Osman Mizima Pasha, was appointed Turkish ambassador to the United States, but was later succeeded by A. Rustem Bey. The latter, on his arrival in the United States in August, indulged in severe criticism of the United States government, and soon after departed for Turkey, presumably not to return.

There were comparatively few changes among the ministers of the United States to foreign countries during the year. Arthur Bailly-Blanchard, former secretary of the embassy at Tokio, was appointed minister to Haiti. The President nominated Ira. N. Morris, of Chicago, minister to Sweden. George Fred Williams, minister to Greece, resigned in July, after a remarkable statement issued to the public criticising the methods of European powers in Albania (q.v.). Garrett Droppers was appointed minister to Greece to succeed Mr. Williams. The following table gives the list of ambassadors and ministers from the United States to foreign countries and from foreign countries to the United States.

AMBASSADORS

FEDERAL JUDICIARY. There was only one change in the membership of the United States Supreme Court in 1914. In August the President appointed James C. McReynolds, Associate Justice, to fill the vacancy caused by the death of Justice Lurton. The membership of the court with the year of their appointment in parenthesis is given as follows: Chief Justice, Edward Douglas White of Louisiana (1910). Associate Justices: Joseph McKenna, California (1898); Oliver Wendell Holmes, Massachusetts (1902); William R. Day, Ohio (1903); Charles Evans Hughes, New York (1910); Willis Van Devanter, Wyoming (1910); Joseph R. Lamar, Georgia (1910); Mahlon Pitney, New Jersey (1912); James Clark McReynolds, Tennessee (1914).

The membership of the other Federal Courts in 1914 is given below:

COURT OF CLAIMS. Chief Justice, Edward Kernan Campbell. Associate Judges: Charles Bowen Howry, Fenton Whitlock Booth, Samuel Stebbins Barney, George Wesley Atkinson.

COURT OF CUSTOMS APPEALS. Presiding Judge, Robert M. Montgomery. Associate Judges: James F. Smith, Orion M. Barber, Marion De Vries, and George E. Martin.

CIRCUIT COURTS. The Circuit Courts comprise nine judicial circuits, and in each of these a justice of the Supreme Court has jurisdiction. There are in addition other circuit judges for each of the circuits.

CONGRESS

The sessions of Congress included in this résumé are the first regular session of the Sixty-third Congress, which convened on Dec. 2, 1913, and the second or short session of this Congress which convened on Dec. 7, 1914. To make the narrative consecutive it will be necessary to include a short summing up of the proceedings of

that part of the first session which took place in 1913. Upon the convening of Congress on Dec. 2, 1913, the President read his annual message, which was brief and occupied only thirty minutes for delivery. (See 1913 YEAR BOOK.)

On December 3 the House passed the Hay Volunteer Army Bill providing for the raising of a volunteer army at the time of actual or threatened war to number 242,000 men, exclusive of militia or regulars. The Senate, on December 6, passed the Hetch-Hetchy Bill, providing for a water supply for San Francisco, by a vote of 43 to 25. It had already passed the House. Hearings were held in the Senate over the admission of Blair Lee, elected Senator from Maryland, and Frank P. Glass, who had been appointed Senator from Alabama to succeed Senator Johnston. Senator Blair was later admitted, while the Senate voted to exclude Mr. Glass. Congress then adjourned for the Christmas holidays.

TRUST BILLS. On January 20 Congress reassembled, and on the same day President Wilson read his message concerning additional anti-trust legislation. His recommendations included a prohibition of interlocking directorates of banks, railroads, industrial, commercial, and public service bodies; the passage of measures empowering the Interstate Commerce Commission to superintend and regulate the future capitalization of railroads; the passage of measures supplementing the Sherman law by explicit definitions of the practices of monopoly; the creation of an Interstate Trade Commission to form a clearing house for the facts in relation to business and to act as an instrument supplementary to the courts in doing justice to business monopolies; the passage of measures imposing penalties, not upon business itself, but upon individuals responsible for improper practices; the passage of measures prohibiting holding companies and restricting the interlocking owner-

FOUR UNITED STATES SENATORS PROMINENT IN 1914

ship of corporations by individuals; the passage of measures permitting private claimants to found suits for redress against monopolies under the Sherman law upon the results of government suits against those monopolies. President Wilson's address was received by Congress with the closest attention and his reading of it was frequently interrupted by hearty applause.

Bills embodying these recommendations had already been introduced into the House with the exception of the measure designed to supplement the Sherman act by defining practices and methods which are illegal, and providing for the supervision of all issues of railway stock and bonds, and this bill was introduced shortly after the President's address.

At a caucus held in the House on May 12 it was agreed to pass before adjournment only the three anti-trust measures and the annual appropriation bills. Debate began in the House on the anti-trust bills on May 19 and continued until June 5, when all three measures were passed. The bill creating an Interstate Trade Commission was adopted without a roll call. The Clayton Bill was passed by a vote of 275 to 54 and the Railway Capitalization Bill by a vote of 325 to 12. On July 1 the Democratic members of the Senate in caucus agreed to hold the Senate in session until the trust bills were disposed of. On July 22 the Clayton Anti-trust Bill was favorably reported with amendments in the Senate. On August 5 the Senate, by a vote of 53 to 16, passed the bill creating a Federal Trade Commission, 2 Democrats voting against the measure and 12 Republicans for it. On September 2 the Clayton Bill was passed in the Senate by a vote of 46 to 16, 7 Republicans and 1 Progressive Senator voting for it. On September 8 the Senate, by a vote of 43 to 5, agreed to the conference report on the Trade Commission Bill. The conference committees of the two Houses reached an agreement upon conditions of the Clayton Bill, and on October 5 the Senate adopted the report by a vote of 35 to 24. The report was adopted on October 8 in the House by a vote of 244 to 54. The conference report on the Anti-trust Bill resulted in a long and somewhat acrimonious debate led by Senator Reed of Missouri, who spoke for two days in opposition to the acceptance of the report which he asserted was a betrayal of the Democratic party. He complained because the criminal penalty for price discrimination, tying contracts, and holding companies had been stricken out, together with a provision authorizing the courts to appoint receivers and sell the property of convicted corporations. For a full discussion of these bills, see TRUSTS.

PANAMA CANAL TOLLS BILL. For a general discussion of this bill and its passage through Congress, see PANAMA CANAL TOLLS.

ALASKA RAILROAD BILL. This measure, which was one of those recommended in the President's message at the beginning of this session of Congress, is discussed in the article ALASKA.

WOMAN SUFFRAGE. An amendment to the Constitution providing for woman suffrage came to a vote in the Senate on March 19. It failed to pass that body by a vote of 35 to 34—two-thirds vote was required to pass the resolution. After its rejection Senator Shafroth, of Colorado, an advocate of woman suffrage, introduced another resolution requiring a popular vote on the question in any State when more than 5 per cent

of the voters petitioned for it, but this resolution did not come to a vote during this session.

MEXICO. On April 20 both branches of Congress assembled in the House chamber and were addressed by the President on the Mexican crisis. On the same day the Senate passed the bill which had previously been passed in the House providing for the raising of a volunteer army in the time of actual or threatened war. The House resolution authorizing the President to use force in Mexico was adopted by a vote of 337 to 37. On April 21 a similar resolution with amendments was adopted in the Senate, which amendments were accepted by the House on the following day. For a discussion of the relations of the United States and Mexico during the year, see MEXICO.

CONGRESS AND THE WAR. Congress was prompt to respond to the emergency brought about by the war in Europe. (See WAR OF THE NATIONS.) On August 3 the House adopted a bill made to assist American trade interests in the European crisis by liberalizing existing laws so as to permit the immediate registry of foreign-built ships under certain conditions. There were previous to this time many ships, numbering about 150, with a total measurement of nearly 1,000,000 tons, owned by Americans under foreign flags. The bill as passed by the Senate admitted newly purchased and registered ships to coastwise trade, and authorized the President in an emergency so to admit them. There was an objection to the measure, and in a conference between the two Houses the provision objected to by a minority was made broader, authorizing all foreign-built ships admitted to American registry within two years to engage in the coastwise trade. The Senate rejected the conference committee's report, and, by a vote of 40 to 20, passed the bill in the form in which it had been submitted by the House. In this way the Senate rejected its own amendments and the changes reported by the conference committee, and the provisions permitting the newly registered foreign-built ships to enter the coastwise trade were lost. The rejection of these provisions was due mainly to the objections of the owners of coastwise ships and the shipyards, and the petitions of shipyard employees. The bill finally passed and signed was the House bill. To supplement this bill and to promote the transfer or purchase of ships, the government proposed the creation of a War Risk Insurance Bureau in the Treasury Department, with a fund of \$5,000,000. A bill for such a bureau, favorably reported in the Senate and the House, was passed, and on August 21 the Senate adopted an emergency measure appropriating \$5,000,000 to insure American vessels and their cargoes against loss by war. A similar bill was passed by the House on August 29. On September 4 both Houses assembled in the House chamber and were addressed by the President on the necessity of providing additional revenue to meet the deficit which would be created by the falling off of imports from the countries affected by the war.

On September 21 there was introduced into the House an emergency revenue bill, providing for the raising of \$105,000,000 by special taxes on beer and wines, gasoline, brokers and bankers, tobacco dealers' license, on theatres in towns of more than 15,000, circuses and other shows, public billiard rooms, and bowling alleys. Checks, drafts, foreign bills of exchange, letters

of credit, and leases of land or tenements are exempted from the stamp tax. The stamp taxes remain in force until December 31, 1915, but the others are to run until repealed. The House passed the War Revenue Bill on September 25, by a vote of 234 to 135, 1 Progressive voting with the majority, and 11 Democrats and the other Progressives joining with the solid Republican minority. An amendment to the War Revenue Bill, which led to a sharp contest, was offered by Senator Smith of Georgia. It provided for an issue of \$250,000,000 in bonds, to be used by the government in buying 5,000,000 bales of cotton at ten cents a pound, the cotton to be held a year or two and then to be sold at a price not below eleven cents. The amendment also provided for a tax designed to reduce the planted area of cotton and the crop by one-half. After a long and somewhat bitter debate the amendment was rejected by a vote of 21 to 40. After many changes were made in the Senate the bill was passed on October 17 by a vote of 34 to 22. All the Republicans and 2 Democrats voted in the negative.

RIVER AND HARBOR BILL. On September 18-19 there was conducted in the Senate one of the most remarkable filibusters known in the history of that body. This was carried on by Senator Burton of Ohio and Senator Kenyon of Iowa, and its purpose was the reduction of the appropriation carried by the River and Harbor Bill. As it was originally submitted to the Senate the bill carried appropriations of about \$53,000,000. Efforts were made to strike out a large proportion of these appropriations in the Senate, but they failed because the Senators, whose constituents were thus threatened with disappointment, were determined to push the bill through to passage by keeping the Senate in continuous session till it was accomplished. Senator Burton proceeded to talk against the bill all one night and until 4 o'clock on the next afternoon. He was aided by other Senators and through their efforts Senator Simmons, who had the bill in charge, consented to have the amount carried by the bill reduced to \$20,000,000, and to have the appropriation thus made used for the carrying on of existing projects.

SIXTY-THIRD CONGRESS—END OF FIRST SESSION. Congress adjourned on October 24 after a continuous session of 1 year, 6 months, and 17 days, this being the longest continuous session since the beginning of the government. The two Houses met in extraordinary session on April 7, 1913, sat through the summer and fall, and on December 1 the extraordinary session merged into the regular session without a break. Congress then sat all winter, all summer, and in the fall finally adjourned as noted above on Oct. 24, 1914, to meet again on December 1, for the regular short session. The continuous session was remarkable not only for its length, but for the fact that it signalized the return of the Democratic party to complete power, after sixteen years of opposition.

The European War made it necessary to pass four measures—the War Revenue Bill; an act admitting foreign-built ships to American registry; the War Risk Insurance Bureau Bill; the bill for large increases of emergency currency. Measures which would have been important but for the greater acts which overshadowed them were also enacted. These include a measure providing for the Federal construction and ownership of railways in Alaska; the use of Hetch-

Hetchy Valley as a water supply for San Francisco; the regulation of dealing in cotton futures on cotton exchanges; leasing of Alaska coal lands; limitation to eight hours of women's labor in the District of Columbia; regulation and taxation of imports of opium; and the cutting down of the appropriation for rivers and harbors from \$53,000,000 to \$20,000,000. There were several subjects considered during the session, but not completed. These include the Seamen's Bill; the Nicaraguan and Colombian treaties; a measure providing for Federal owned merchant marine; Immigration Bill, with literacy test; a measure providing for Philippine government; several conservation measures dealing with water powers and mining lands; a bill providing for farm land banks; and a measure providing for Federal regulation of the Stock Exchange through the Post Office Department.

The Sixty-third Congress failed to carry out the promises made in the Democratic national platform in 1912 for a reduction of the expenditures of the government, and for this it was severely criticised not only by Republicans, but by Democratic leaders. (For the amount of appropriations made, see table below.)

SIXTY-THIRD CONGRESS—SECOND SESSION. The second or short session of the Sixty-third Congress convened on December 7, and on the following day the President delivered his annual address, which was short and from its tone was not only an address to Congress but also to the American people. President Wilson made few recommendations and urged no new legislation. The most important measures, the passage of which he recommended, related to the war in Europe. In the opinion of the President two things were necessary to meet the situation. First the resources of the country must be developed, and second a merchant marine must be created to distribute these resources to the markets which await them. To accomplish these purposes he recommended the passage of three measures pending in Congress. Two related to conservation and had already passed the House, and the third was the shipping bill providing for a government owned merchant marine. As a reason for passing this bill Mr. Wilson made these assertions: First, that goods cannot be carried to the empty markets that await them if no ships are available; second, ships will not be available if we wait for the trade to develop without them; third, "To retrace the steps by which we have, it seems almost deliberately, withdrawn our flag from the seas . . . would take a long time" and much detailed legislation, "and the trade which we ought immediately to handle would disappear or find other channels while we debated the items"; fourth, the government must be enabled to open wide these gates of trade before it is altogether profitable to open them, or altogether reasonable to ask private capital to open them at a venture; fifth, the government should provide shipping facilities where to provide them would not be at first profitable, and should withdraw when the project has become sufficiently profitable to attract private capital. In addition to these measures the President advocated the passage of the bill giving a larger measure of self-government to the Philippines. (See PHILIPPINES.) Perhaps the most interesting of the subjects treated by the President in his address was the question of national defense. Shortly before the meeting of

Congress the matter had been made a live issue in newspapers and elsewhere and the naval and military conditions existing had been severely criticised. (See sections *Army and Navy*.) The President declared that there was no reason to fear threats against the independence or territorial integrity of the United States. He asserted that the United States had always had a clear and settled policy as to military establishments and that there was neither need nor desire for a large standing army. Reliance must be made in time of natural peril not upon a standing army, nor upon a reserve army, but upon a citizenry trained and accustomed to arms. A system must be provided by which every citizen who will volunteer for the training may be made familiar with the use of modern arms, the rudiments of drill and maneuver, and the maintenance and sanitation of camps.

In relation to the navy, the President made the following statement: "A powerful navy we have always regarded as our proper and natural means of defense. . . . We shall take leave to be strong upon the seas, in the future as in the past; and there will be no thought of offense or of provocation in that. Our ships are our natural bulwarks."

On the day following the delivery of the President's address, the Ship Purchase Bill, having already passed the House in the preceding session, was introduced in the Senate by Senator Stone. In the House the Committee on Naval Affairs began an investigation into naval preparedness, Admiral Fletcher, commanding the Atlantic Fleet, Secretary Daniels, and others being heard by the committee. The Ship Purchase Bill was reported favorably by the Committee on Commerce in the Senate on December 16. On the following day Senator Lodge introduced a measure embodying the plans of Secretary Garrison for increasing the army. (See section *Army*.)

The House on December 21 passed the Lever Bill, authorizing Federal licenses for warehouses for cotton, grain, and other nonperishable agricultural products. On December 22 the proposed amendment to the Constitution providing for nation-wide prohibition was voted on in the House, where it received a majority vote of 197 to 189, but not the required two-thirds vote.

On December 23 both branches of Congress adjourned for the holiday recess, but convened again on December 29. The Ship Purchase Bill was reported in the Senate on December 30.

CONGRESSIONAL REPRESENTATION. Following is a list of the Senators and representatives in Congress in the Sixty-third Congress. The dates following the names of the Senators indicate the expiration of their term of service.

[Democrats in roman; Republicans in *italics*; Progressive Republicans in *italics* with *; Progressives in SMALL CAPS; Independent in CAPS.]

ALABAMA.—SENATORS: John H. Bankhead, 1919; Francis S. White, 1915. REPRESENTATIVES (Democrats, 10): At large, John W. Abercrombie; George W. Taylor, S. Hubert Dent, Jr., W. O. Mulkey, Fred L. Blackmon, J. Thomas Heflin, Richmond P. Hobson, John L. Burnett, Christopher C. Harris, Oscar W. Underwood.

ARIZONA.—SENATORS: Henry F. Ashurst, 1917; Marcus A. Smith, 1915. REPRESENTATIVES (Democrat, 1): At large, Carl Hayden.

ARKANSAS.—SENATORS: James P. Clarke, 1915; Joe T. Robinson, 1919. REPRESENTATIVES (Democrats, 7): Thaddeus H. Caraway, William A. Oldfield, John

C. Floyd, Otis Wingo, H. M. Jacoway, Samuel M. Taylor, William S. Goodwin.

CALIFORNIA.—SENATORS: *George O. Perkins*, 1915; John D. Works, 1917. REPRESENTATIVES (Democrats, 8; Republicans, 4; Progressive Republicans, 2; Progressive, 1; Independent, 1): WILLIAM KENT, John E. Raker, Charles F. Curry, Julius Kahn, John I. Nolan, Joseph H. Knowland, Denver S. Church, *Everett A. Hayes*, Charles W. Bell,* William D. Stephens,* William Kettner.

COLORADO.—SENATORS: Charles S. Thomas, 1915; John F. Shafroth, 1919. REPRESENTATIVES (Democrats, 4): At large, Edward T. Taylor, Edward Keating; George J. Kindel, H. H. Seldomridge.

CONNECTICUT.—SENATORS: Frank B. Brandegee, 1915; George P. McLean, 1917. REPRESENTATIVES (Democrats, 5): Augustine Lonergan, Bryan F. Mahan, Thomas L. Reilly, Jeremiah Donovan, William Kennedy.

DELAWARE.—SENATORS: Henry A. du Pont, 1917; Willard Saulsbury, 1919. REPRESENTATIVE, (Democrat, 1): At large, Franklin Brockson.

FLORIDA.—SENATORS: Duncan U. Fletcher, 1915; Nathan P. Bryan, 1917. REPRESENTATIVES (Democrats, 4): At large, Claude L'Engle; Stephen M. Sparkman, Frank Clark, Emmett Wilson.

GEORGIA.—SENATOR: Hoke Smith, 1915; Thomas W. Hardwick, 1919. REPRESENTATIVES (Democrats, 12): Charles G. Edwards, Frank Park, Charles R. Crisp, William C. Adamson, William S. Howard, Charles L. Bartlett, Gordon Lee, Samuel J. Tribble, Thomas M. Bell, Carl Vinson, J. Randall Walker, Dudley M. Hughes.

IDAHO.—SENATORS: William E. Borah, 1919; James H. Brady, 1915. REPRESENTATIVES (Republicans, 2): At large, Burton L. French, Addison T. Smith.

ILLINOIS.—SENATORS: J. Hamilton Lewis, 1919; Lawrence F. Sherman, 1915. REPRESENTATIVES (Democrats, 19; Republicans, 4; Progressive Republican, 1; Progressives, 2; vacancy, 1): At large, Lawrence B. Stringer, William E. Williams; Martin B. Madden, James R. Mann, George E. Gorman, Adolph J. Sabath, James McAndrews, Frank Buchanan, Thomas Gallagher, Fred A. Britten, Chas. M. Thomson, Ira C. Copley,* Wm. H. HINEBAUGH, John O. McKenzie, Clyde H. Tavenner, Stephen A. Hoxworth, Claudius U. Stone, Louis FitzHenry, Frank T. O'Hair, Charles M. Borchers, Henry T. Rainey, James M. Graham, William N. Baltz, Martin D. Foster, H. Robert Fowler, Robert P. Hill.

INDIANA.—SENATORS: Benjamin F. Shively, 1915; John W. Kern, 1917. REPRESENTATIVES (Democrats, 13): Charles Lieb, William A. Cullop, William E. Cox, Lincoln Dixon, Ralph W. Moss, Finly H. Gray, Charles A. Korbly, John A. M. Adair, Martin A. Morrison, John B. Peterson, George W. Rauch, Cyrus Cline, Henry A. Barnhart.

IOWA.—SENATORS: Albert B. Cummins, 1915; William S. Kenyon, 1919. REPRESENTATIVES (Democrats, 8; Republicans, 8): Charles A. Kennedy, Henry Vollmer, Maurice Connolly, Gilbert N. Haugen, James W. Good, Sanford Kirkpatrick, S. F. Prouty, Horace M. Townner, William R. Green, Frank P. Woods, George O. Scott.

KANSAS.—SENATORS: Joseph L. Bristow, 1915; William H. Thompson, 1919. REPRESENTATIVES (Democrats, 5; Republicans, 2; Progressive, 1): Daniel R. Anthony, Jr., Joseph Taggart, Philip P. Campbell, Dudley Doolittle, Guy T. Heavering, John R. Connelly, George A. Neeley, VICTOR MURDOCK.

KENTUCKY.—SENATORS: Ollie M. James, 1919; Johnson N. Camden, 1915. REPRESENTATIVES (Democrats, 9; Republicans, 2): Alben W. Barkley, Augustus O. Stanley, Robert Y. Thomas, Jr., Ben Johnson, Swagar Sherley, Arthur B. Rouse, J. Campbell Cantrill, Harvey Helm, W. J. Fields, John W. Langley, Caleb Powers.

LOUISIANA.—SENATORS: John R. Thornton, 1915; Joseph E. Ransdell, 1919. REPRESENTATIVES (Democrats, 8): Albert Estopinal, H. Garland Dupré, Robert F. Broussard, John T. Watkins, Walter Elder, Lewis L. Morgan, Ladislav Lazzaro, James B. Aswell.

MAINE.—SENATORS: Charles F. Johnson, 1917; Edwin C. Burleigh, 1919. REPRESENTATIVES (Democrats, 1; Republicans, 8): Asher C. Hinds, Daniel J. McGillicuddy, John A. Peters, Frank E. Guernsey.

MARYLAND.—SENATORS: John Walter Smith, 1915; Blair Lee, 1917. REPRESENTATIVES (Democrats, 6): Jesse D. Price, J. Fred. O. Talbot, Charles P. Coady, J. Charles Linthicum, Frank O. Smith, David J. Lewis.

MASSACHUSETTS.—SENATORS: Henry Cabot Lodge, 1917; John W. Weeks, 1919. REPRESENTATIVES (Democrats, 6; Republicans, 8; vacancies, 2): Allen T. Treadway, Frederick H. Gillett, Calvin D.

† Relected in 1914.

Paige, Samuel B. Winslow, John J. Rogers, Augustus P. Gardner, M. F. Phelan, Frederick S. Deitrick, Ernest W. Roberts, James A. Gallivan, John J. Mitchell, Edward Gilmore, William S. Greene, Thomas C. Thacher.

MICHIGAN.—SENATORS: *William Alden Smith, 1919; Charles E. Townsend, 1917. REPRESENTATIVES* (Democrats, 2; Republicans, 9; Progressives, 2): At large, *Patrick H. Kelley, Frank E. Doremus, Samuel W. Beakes, J. M. C. Smith, Edward L. Hamilton, Carl E. Mapes, Samuel W. Smith, Louis O. Cramton, Joseph W. Fordney, James C. McLaughlin, Roy O. Woodruff, Francis O. Lindquist, William J. MacDonald.*

MINNESOTA.—SENATORS: *Knute Nelson, 1919; Moses E. Clapp, 1917. REPRESENTATIVES* (Democrat, 1; Republicans, 9): At large, *James Manahan; Sydney Anderson, Winfield S. Hammond, Charles R. Davis, Frederick O. Stevens, George R. Smith, Charles A. Lindbergh, Andrew J. Volstead, Clarence B. Miller, Halvor Steenerson.*

MISSISSIPPI.—SENATORS: *John Sharp Williams, 1917; James K. Vardaman, 1919. REPRESENTATIVES* (Democrats, 8): *Ezekiel S. Candler, Jr., Hubert D. Stephens, Benj. G. Humphreys, Thomas U. Sisson, S. A. Witherspoon, B. P. Harrison, Percy E. Quin, James W. Collier.*

MISSOURI.—SENATORS: † *William J. Stone, 1915; James A. Reed, 1917. REPRESENTATIVES* (Democrats, 15; Republican, 1): *James T. Lloyd, William W. Rucker, Joshua W. Alexander, Charles F. Booher, William P. Borland, Clement C. Dickinson, Courtney W. Hamlin, Dorsey W. Shackelford, Champ Clark, Richard Bartholdt, William L. Igoe, Michael J. Gill, Walter L. Hensley, Joseph J. Russell, Perl D. Decker, Thomas L. Rubey.*

MONTANA.—SENATORS: *Henry L. Myers, 1917; Thomas J. Walsh, 1919. REPRESENTATIVES* (Democrats, 2): At large, *John M. Evans, Tom Stout.*

NEBRASKA.—SENATORS: *Gilbert M. Hitchcock, 1917; George W. Norris, 1919. REPRESENTATIVES* (Democrats, 3; Republicans, 3): *John A. Maguire, C. O. Lobeck, Dan V. Stephens, Charles H. Sloan, Silas R. Barton, Moses P. Kinkaid.*

NEVADA.—SENATORS: † *Francis G. Newlands, 1919; Key Pittman, 1917. REPRESENTATIVE* (Republican, 1): At large, *E. E. Roberts.*

NEW HAMPSHIRE.—SENATORS: † *Jacob H. Gahnger, 1915; Henry F. Hollis, 1919. REPRESENTATIVES* (Democrats, 2): *Eugene E. Reed, Raymond B. Stevens.*

NEW JERSEY.—SENATORS: *James E. Martine, 1917; William Hughes, 1919. REPRESENTATIVES* (Democrats, 9; Republicans, 2; vacancy, 1): *William J. Browning, J. Thompson Baker, Thomas J. Scully, Allan B. Walsh, Wm. E. Tuttle, Jr., Archibald C. Hart, Dow H. Drucker, Eugene F. Kinkead, Edward W. Townsend, John J. Eagan, James A. Hamill.*

NEW MEXICO.—SENATORS: *Thomas B. Catron, 1917; Albert B. Fall, 1919. REPRESENTATIVE* (Democrat, 1): At large, *H. B. Ferguson.*

NEW YORK.—SENATORS: *Elihu Root, 1915; James A. O'Gorman, 1917. REPRESENTATIVES* (Democrats, 31; Republicans, 11; Progressive, 1): *Lathrop Brown, Denis O'Leary, Frank E. Wilson, Harry H. Dale, James P. Maher, William M. Calder, John J. Fitzgerald, Daniel J. Griffin, James H. O'Brien, Herman A. Metz, Daniel J. Riordan, Henry M. Goldfogel, George W. Loft, Jefferson M. Levy, Michael F. Conry, Peter J. Dooling, John F. Carew, Thomas G. Patten, Walter M. Chandler, Jacob A. Cantor, Henry George, Jr., Henry Bruckner, Joseph A. Goulden, Woodson R. Oglesby, Benjamin I. Taylor, Edmund Platt, George McClellan, Peter G. Ten Eyck, James S. Parker, Samuel Wallin, E. A. Merritt, Jr., Luther W. Mott, Charles A. Talcott, George W. Fairchild, John R. Clancy, Sereno E. Payne, Edwin S. Underhill, Thomas B. Dunn, Henry G. Danforth, Robert H. Gittins, Charles B. Smith, Daniel A. Driscoll, Charles M. Hamilton.*

NORTH CAROLINA.—SENATORS: *F. M. Simmons, 1919; † Lee S. Overman, 1915. REPRESENTATIVES* (Democrats, 10): *John H. Small, Claude Kitchin, John M. Faison, Edward W. Pou, Charles M. Stedman, Hannibal L. Godwin, Robert N. Page, Robert L. Doughton, Edwin Y. Webb, James M. Gudger, Jr., L. Clancy, Sereno E. Payne, Edwin S. Underhill, Thomas B. Dunn, Henry G. Danforth, Robert H. Gittins, Charles B. Smith, Daniel A. Driscoll, Charles M. Hamilton.*

NORTH DAKOTA.—SENATORS: *Porter J. McCumber, 1917; † Asle J. Gronna, 1919. REPRESENTATIVES* (Republicans, 3): *Henry T. Helgesen, George M. Young, Patrick D. Norton.*

OHIO.—SENATORS: *Theodore E. Burton, 1915; Atlee Pomerene, 1917. REPRESENTATIVES* (Democrats, 18; Republicans, 3; vacancy, 1): At large, *Robert Crosser; Stanley E. Bowdle, Alfred G. Allen, Warren Gard, J. H. Goeke, Timothy T. Ansberry, Simon D. Fess, James D. Post, Frank B. Willis, Isaac R. Sher-*

wood, Robert M. Switzer, Horatio O. Claypool, Clement Brumbaugh, John A. Key, George White, W. B. Francis, William A. Ashbrook, John J. Whitacre, E. B. Bathrick, William Gordon, Robert J. Bulkley.

OKLAHOMA.—SENATORS: † *Thomas P. Gore, 1915; Robert L. Owen, 1919. REPRESENTATIVES* (Democrats, 6; Republicans, 2): At large, *William H. Murray, Joseph B. Thompson, Claude Weaver; Bird McGuire, Dick T. Morgan, James S. Davenport, Charles D. Carter, Scott Ferris.*

OREGON.—SENATORS: † *George E. Chamberlain, 1915; Harry Lane, 1919. REPRESENTATIVES* (Republicans, 2; Progressive Republican, 1): *Willis C. Hawley, Nicholas J. Sinnott, A. W. LaFerty.*

PENNSYLVANIA.—SENATORS: † *Boies Penrose, 1915; George T. Oliver, 1917. REPRESENTATIVES* (Democrats, 12; Republicans, 17; Progressive Republican, 1; Progressives, 6): At large, *FRED E. LEWIS, John M. Morin, ARTHUR R. RUPLEY, ANDERSON H. WALTERS, William S. Vare, George S. Graham, J. Hampton Moore, George W. Edmonds, Michael Donohoe, J. Washington Logue, Thomas S. Butler, Robt. E. Difenderfer, William W. Griest, John R. Farr,* John J. Casey, Robert E. Lee, John H. Rothermel, W. D. B. Ainey, Edgar R. Kiees, John V. Leshner, Frank L. Dershem, Aaron S. Kreider, Warren W. Bailey, Andrew R. Brodbeck, Charles E. Patton, Abraham L. Keister, Woods N. Carr, HENRY W. TEMPLE, Milton W. Shreve, A. Mitchell Palmer, Jonathan N. Langham, WILLIS J. HULINGS, Stephen G. Porter, M. CLYDE KELLY, James Francis Burke, Andrew J. Barchfield.*

RHODE ISLAND.—SENATORS: *Henry F. Lippitt, 1917; LeBaron B. Colt, 1919. REPRESENTATIVES* (Democrats, 2; Republicans, 1): *Geo. F. O'Shaunessy, Peter G. Gerry, Ambrose Kennedy.*

SOUTH CAROLINA.—SENATORS: *Benjamin R. Tillman, 1919; † Ellison D. Smith, 1915. REPRESENTATIVES* (Democrats, 7): *Richard S. Whaley, James F. Byrnes, Wyatt Aiken, Joseph T. Johnson, David E. Finley, J. Willard Ragdale, Asbury F. Lever.*

SOUTH DAKOTA.—SENATORS: *Coe I. Crawford, 1915; Thomas Sterling, 1919. REPRESENTATIVES* (Republicans, 3): *Charles H. Dillon, Charles H. Burke, Eben W. Martin.*

TENNESSEE.—SENATORS: *Luke Lea, 1917; John K. Shields, 1919. REPRESENTATIVES* (Democrats, 8; Republicans, 2): *Sam R. Sells, Richard W. Austin, John A. Moon, Cordell Hall, William C. Houston, Joseph W. Byrns, Lemuel P. Fadgett, Thetus W. Sims, Finis J. Garrett, Kenneth D. McKellar.*

TEXAS.—SENATORS: *Charles A. Culberson, 1917; Morris Sheppard, 1919. REPRESENTATIVES* (Democrats, 18): At large, *Daniel E. Garrett, Hattin W. Summers, Horace W. Vaughan, Martin Dies, James Young, Sam Rayburn, Jack Beall, Rufus Hardy, A. W. Gregg, Joe H. Eagle, George F. Burgess, James P. Buchanan, Robert L. Henry, Oscar Callaway, John H. Stephens, James L. Slayden, John N. Garner, William R. Smith.*

UTAH.—SENATORS: † *Reed Smoot, 1915; George Sutherland, 1917. REPRESENTATIVES* (Republicans, 2): At large, *Joseph Howell, Jacob Johnson.*

VERMONT.—SENATORS: † *William P. Dillingham, 1915; Carroll S. Page, 1917. REPRESENTATIVES* (Republicans, 2): *Frank L. Greene, Frank Plumley.*

VIRGINIA.—SENATORS: *Thomas S. Martin, 1919; Claude A. Swanson, 1917. REPRESENTATIVES* (Democrats, 9; Republicans, 1): *William A. Jones, E. E. Holland, Andrew J. Montague, Walter A. Watson, Edward W. Saunders, Carter Glass, James Hay, Charles C. Carlin, C. Bacon Stemp, Henry D. Flood.*

WASHINGTON.—SENATORS: † *Wesley L. Jones, 1915; MILES POINDEXTER, 1917. REPRESENTATIVES* (Republicans, 3; Progressives, 2): At large, *JAMES W. BRYAN, J. A. FALCONER; William E. Humphrey, Albert Johnson, William L. La Follette.*

WEST VIRGINIA.—SENATORS: *William E. Chilton, 1917; Nathan Goff, 1919. REPRESENTATIVES* (Democrats, 2; Republicans, 4): At large, *Howard Sutherland; M. M. Neely, William G. Brown, Jr., Samuel B. Avis, Hunter H. Moss, Jr., James A. Hughes.*

WISCONSIN.—SENATORS: *Robert M. La Follette, 1917; Isaac Stephenson, 1915. REPRESENTATIVES* (Democrats, 3; Republicans, 8): *Henry A. Cooper, Michael E. Burke, John M. Nelson, William J. Cary, William H. Stafford, Michael K. Reilly, John J. Eck, Edward E. Browne, Thomas F. Konop, James A. Frear, Irvine L. Lenroot.*

WYOMING.—SENATORS: *Clarence D. Clark, 1917; Francis E. Warren, 1919. REPRESENTATIVE* (Republican, 1): At large, *Frank W. Mondell.*

ALASKA.—JAMES WICKESHAM.

HAWAII.—J. KALANIANAOLE.

PHILIPPINES.—Manuel L. Queson, Manuel E. Barnshaw.

PORTO RICO.—Luis Muñoz Rivera.

† Re-elected in 1914.

APPROPRIATIONS. The following table gives the amount appropriated by Congress during sessions of the Sixty-third Congress:

	1914	1915
Deficiencies	\$27,030,512.29	\$23,828,999.41
Legislative, Executive and Judicial	85,172,484.50	87,680,781.87
Sundry Civil	106,749,582.01	103,080,275.74
Support of the Army	94,266,145.51	101,019,212.50
Naval Service	140,718,434.53	144,868,716.61
Indian Service	9,486,819.87	9,771,902.76
Rivers and Harbors	51,118,889.00	26,989,000.00
Ports and Fortifications	5,218,250.00	5,627,700.00
Military Academy	1,099,784.87	997,788.54
Post Office Department	Indefinite	Indefinite
Pensions	180,300,000.00	169,150,000.00
Consular and Diplomatic	3,780,642.66	4,809,856.66
Agricultural Department	17,986,945.00	19,865,832.00
District of Columbia	11,383,739.00	12,171,457.28
Reclamation Fund		
Reliefs and Miscellaneous	445,197.22	14,878,428.99
Totals	\$634,757,276.26	\$674,190,062.86

SIXTY-FOURTH CONGRESS. The elections of Nov. 3, 1914, which are treated somewhat in detail in the section *Elections in 1914*, determined the political complexion of the Sixty-fourth Congress. In the Sixty-third Congress there were in the House 291 Democrats, 124 Republicans, 19 Progressives, and 1 Independent. The results of the elections reduced the Democratic membership to 232; increased the Republican membership to 194; decreased the Progressive membership to 7. The Independent membership remained the same, and a Socialist member was elected from New York. The Senate in the Sixty-third Congress was composed of 53 Democrats, 42 Republicans, and 1 Progressive. As a result of November elections the Democratic membership was increased to 56; the Republican membership reduced to 39; while the Progressive membership remained the same. Thus while there resulted in a considerable decrease in the Democratic majority in the House, the majority in that party in the Senate was increased. New Senators elected to the Sixty-fourth Congress are the following:

Oscar W. Underwood, Alabama, succeeding F. S. White.

James D. Phelan, California, succeeding George C. Perkins.

Thomas W. Hardwick, Georgia, succeeding Augustus O. Bacon.

J. C. W. Beckham, Kentucky, succeeding John N. Camden.

Robert F. Brussard, Louisiana, succeeding John R. Thornton.

Warren G. Harding, Ohio, succeeding Theodore E. Burton.

E. S. Johnson, South Dakota, succeeding Coe I. Crawford.

Paul O. Hustung, Wisconsin, succeeding Isaac Stephenson.

Members of the Senate reelected in 1914 are

indicated in the table of membership of the Sixty-third Congress.

ELECTIONS IN 1914

The elections held between Presidential elections are always of interest as tending to indicate the extent to which the people endorse policies of the administration in power. Measured by this test both the supporters and opponents of President Wilson's administration were enabled to derive some satisfaction from the results of the elections of Nov. 3, 1914. While in a measure the most conspicuous feature of the elections was the revival of Republican strength and the remarkable weakness of the Progressive party, the Democrats gained in the Senate although they lost in the House.

In 31 of the 48 States, United States Senators were elected for the first time in the history of the country by direct universal suffrage. In most of the States, State Legislatures and State officers were also elected, and in all States, except Maine, Representatives to Congress were chosen. The Maine elections are held in September. The result of the elections in the different States are treated in the State articles. There will be given here only a general review of the results from a national standpoint.

The official returns from the States show that while the Republican party gained remarkably in the election the total Democratic vote also increased, while not only the Progressive but the Prohibition and Socialist parties lost in the total number of votes. Returns show also that the Democratic popular vote exceeded that of the Republicans.

Of course the chief outstanding fact of the election is found in the decrease in Progressive vote as compared with the total of 1912. The collapse of this party's vote throughout the country is greater indeed than figures indicate, for, of the 1,916,417 votes polled by the party in all the States, 932,679 were polled in only three States—California, Pennsylvania, and Illinois—which have only 80 votes in the Electoral College. Of these three States, the Progressives carried only California, losing in all 2,213,090 votes. The Republicans gained 2,528,418 and the Democrats gained 31,943, while the Socialist and Prohibition losses, respectively, were 214,378 and 14,059.

While the Socialists lost in their total vote, they gained remarkably in some States and succeeded in electing a Congressman in New York. They made large gains in Oklahoma, and gains also in Montana, Virginia, and Nevada. The Prohibition party made gains in several of the States, including Arizona, California, Massachusetts, Minnesota, New York, and Oregon. There were very large Progressive losses in most of the Western States and most of these were gained by the Republican party.

REPUBLICAN CONVENTION DELEGATES. A new plan of representation in the Republican national conventions in 1914 was approved by the party in States which cast a majority of the votes of the Electoral College. As this was the condition attached to the proposition, put forth in December, 1913, the plan was made effective. The new basis of representation reduced the whole number of delegates by 89, and nearly all the loss is in the Southern States. The old plan, based upon the electoral votes of each State, gave

excessive representation in States where the number of Republican voters was small. The new plan is based in part upon the number of Republican votes cast. The losses in delegates suffered by the States are as follows: Alabama, 8; Arkansas, 3; Florida, 4; Georgia, 11; Louisiana, 8; Mississippi, 8; New York, 2; North Carolina, 3; South Carolina, 7; Tennessee, 3; Texas, 16; Virginia, 8; Hawaii, 4; Porto Rico, 2; Philippines, 2. The only Northern State affected is New York.

ADMINISTRATION

The history of the administration of President Wilson in 1914 in its larger and more formal aspects is treated elsewhere in the YEAR BOOK, especially in the article UNITED STATES, sections *Congress* and *Foreign Relations* and in the articles MEXICO, IMMIGRATION, TRUSTS, CURRENCY, BANKS AND BANKING, STRIKES, PANAMA CANAL TOLLS, WOMAN SUFFRAGE, and other general articles dealing with the political and economic history of the United States during the year. This section is intended to cover only those phases of the administration and President Wilson's relation to it which do not properly fall under any of these main topics.

The President's relations with his cabinet continued to be untroubled during the year. He ignored the rather severe criticisms made upon Secretary Bryan and also those hardly less severe made upon Secretary Daniels in his conduct of the Navy Department. On May 4, John Bassett Moore resigned as Counselor of the State Department and Acting Secretary in the absence of Mr. Bryan. In a letter to the President he recalled the fact that at the beginning of his term he had indicated that his tenure was only provisional, his motive being to give service during a period of transition. He said that as the organization of the department's affairs had been completed there was no occasion for his further services. There was a general impression, apparently not unjustified, that Mr. Moore had not found the position an altogether congenial one. Robert Lansing of New York was appointed to succeed him.

The last weeks of 1913 and the first of 1914 the President spent resting at Pass Christian, Miss. On May 17 he spoke at the unveiling of the statue of Commodore John Barry, at Washington, and a few days later made an address on the dedication of the American University in the same city. He unveiled the monument to Confederate dead at the Arlington National Cemetery on June 5, and on the following day spoke at the commencement exercises of the Naval Academy. He was present and made an address at the 4th of July celebration at Independence Hall in Philadelphia. On August 7 the President suffered a great bereavement in the death of Mrs. Wilson, and following this he made no addresses and took part in no social observances during the remainder of the year. In August he took a short vacation at Cornish, N. H. The President expressed himself as satisfied with the results of the elections in November, 1914, and saw in them an endorsement of his policies.

FOREIGN RELATIONS

The year 1914 was one of the most important in respect to relations with other countries in

the history of the United States. Conditions in Mexico became even worse than in 1913. (See MEXICO.) With the exception of Mexico, relations with North American countries were on the whole friendly, although there were more or less serious complications with several of the Central American States.

NICARAGUA. Financial difficulties in Nicaragua resulting from the failure of the effort to arrange for a loan from the United States continued in 1914. The foreign creditors of that country pressed for payment and there was no money in the Treasury. Mr. Bryan said, in January, that the plan for aiding Nicaragua, which was devised by the Taft administration and embodied in a loan convention which the United States Senate would not accept, had not been finally disapproved and excluded by the present Administration. The loan convention, however, was very earnestly opposed by Senator Bacon and other Democrats, and there was a general belief that it would not be ratified. There was also objection among the Democratic members of the Senate to the pending new treaty, which provided that Nicaragua should receive from the United States \$3,000,000 for an exclusive right to construct an interoceanic canal on the Nicaragua route, a naval station in the Gulf of Fonseca, and three small islands. This treaty, with other additions, would virtually establish an American protectorate over Nicaragua. A protest was made by Honduras to the passage of this treaty on the ground that it would prevent a union of the Central American countries, but the treaty received the unanimous approval of the Nicaraguan Senate and House.

On account of opposition to the provisions in the treaty with Nicaragua relating to a practical protectorate on the part of the United States, Secretary Bryan and the Nicaraguan minister in September signed another treaty, shorn of the protectorate features. This treaty was practically a copy of the one negotiated by the Taft administration. It provides for a payment of \$3,000,000 to Nicaragua, which in return is to give to the United States a perpetual option on the Nicaragua interoceanic canal route, a naval station in the Gulf of Fonseca, and two small islands near the east coast. The \$3,000,000 paid to Nicaragua is to be used in liquidating the national debt.

PANAMA. On September 2 a new treaty was signed by the representatives of Panama and the United States government. Under this treaty, which replaces the Davis agreement of 1904, the United States gains control of the waters of Colon and Ancon, together with certain other rights, while a large tract of land known as "The Savannahs" which will place the city of Panama in direct physical communication with the rest of the country hitherto cut off by the canal zone, is ceded to the republic. No railway, however, is to be built across this connecting territory except with the consent of the United States, and it is expressly stipulated in the treaty that for the purpose of defending the canal or any of its approaches it may be retaken and reoccupied at will. The two harbors of Colon and Ancon pass under the absolute control of the United States, and are to be fortified and used as places of operation and defense. The piers on the Colon waterfront, estimated to have cost approximately \$2,500,000, also pass under the control of the American government. This

FOUR UNITED STATES SENATORS ELECTED IN 1914

treaty had been under negotiation for four years, but until September, 1914, it had been impossible to get Panama to give a full agreement.

SANTO DOMINGO. For the United States' intervention in Dominican affairs, see the article DOMINICAN REPUBLIC, *History*.

COLOMBIA. During January negotiations were in progress at Washington and at Bogota for a settlement concerning the secession and independence of the Colombian province of Panama. During the administration of President Taft, Colombia earnestly insisted upon arbitration at The Hague. To this the United States would not consent, but it made a proposition which involved the payment of \$10,000,000, which was rejected by Colombia.

A treaty between the United States and Colombia was signed at Bogota on April 7, and at that time the substance of several of its provisions were published. By the terms of the treaty the United States government was to pay \$25,000,000 as indemnity. The boundary between Colombia and Panama is fixed, but the location of it gives to Colombia a strip of land which is claimed by Panama. It will therefore be necessary to negotiate a new treaty between Panama and Colombia, and the United States government undertakes to use its good offices in support of such a treaty. By other provisions of the treaty the free passage of salt, coal, and oil from Colombian ports is permitted from the Atlantic to the Pacific coast through the Panama Canal, and warships and other vessels are exempted from the payment of Panama Canal tolls. Concession is based upon the consent given by Great Britain for such free passage in 1909, when provisions to that effect were inserted in the Root-Cortez treaty, which Colombia did not accept.

The text of the treaty was published in Bogota on April 14. It was not published in the United States on account of objections of the chairman of the Senate Committee on Foreign Relations. Article I of the treaty as published reads as follows: "The government of the United States, desiring to put an end to all disputes and differences with the republic of Colombia occasioned by events which have brought about the present situation on the Isthmus of Panama, in its name and in the name of the people of the United States, expresses sincere regret for anything that may have interrupted or altered the relations of cordial friendship long existing between the two nations. The government of Colombia, in its name and in the name of the Colombian people, accepts this declaration in the full assurance that every obstacle to the reestablishment of complete harmony between the two countries will thus disappear."

The Colombian Senate on May 2 ratified the treaty with the United States. An official copy, published by a newspaper in Bogota, indicated that the version published some weeks previous in the United States, which was translated from the French was in some details incorrect. The differences were largely those of phraseology, but they were important. Thus in the first published version the United States expressed "sincere regret for anything that may have interrupted or altered the relations of cordial friendship long existing between the two nations." In the copy published in Bogota the United States expressed "sincere regrets that anything should have occurred to interrupt or to mar the rela-

tions of cordial friendship." This change affected what was called by opponents of the treaty an apology on the part of the United States government, and, with respect to that, it was of some importance.

In the latter part of June the Senate Committee on Foreign Relations again took up the treaties between the United States and Nicaragua and Colombia. Secretary Bryan appeared before the committee and defended the treaties. Both agreements were opposed with much bitterness by several members of the committee, one of whom, Mr. Smith, of Michigan, introduced in the Senate a resolution in which sensational charges relating to the treaty with Nicaragua were made. The substance of these was that the continued presence of American marines at Nicaragua's capital, and the support of the United States in other ways, had enabled New York bankers to make large profits at Nicaragua's expense. It was asserted in a resolution that a part of the profit had been derived from bonds of the par value of \$6,250,000, issued by President Zelaya, bought at twenty-five cents on the dollar, and forced upon Nicaragua at par by American pressure; that part had been gained by the control of Nicaragua's railroads; that a fiscal agent appointed by the United States had served the banker's interests, and that Nicaragua had been compelled to pay the salaries of many Americans. The bankers mentioned in the resolution made a denial which was read in the Senate. They declared that they had made no profit by their relations with Nicaragua, but had assisted Nicaragua by adjusting her foreign debt and currency, and improving her customs service.

In reply to severe criticisms made against the treaty with Colombia, Mr. Bryan published a long defense of the agreement. The expression of regret contained in the treaty, he asserted, is identical in meaning and almost identical in words with the expression in the memorandum handed to the Colombian government by the United States minister in President Roosevelt's administration.

At a caucus of Democratic Senators held late in July, it was decided that no action would be taken at that session of Congress on the Colombian or Nicaraguan treaties. In a letter to Senator Stone, chairman of the Committee of Foreign Relations, Mr. Roosevelt made the following statement in relation to his participation in the events which led to the acquisition of the Panama Canal Zone.

"I was President throughout the time of the negotiations, first with Colombia and then with Panama, by which we acquired the right to build the Panama Canal. Every act of this government in connection with these negotiations and with other proceedings for taking possession of the Canal Zone and beginning the building of the canal was taken by my express direction or else in carrying out the course of conduct I, as President, had laid down. I had full knowledge of everything of importance that was done in regard thereto by any agent of the government, and I was solely responsible for what was done. I request to appear before you, to make a full statement of exactly what I did and of what was done by my orders, to state the reasons therefor, and to answer any questions that your body or the members of your body may choose to put to me."

Mr. Roosevelt was not heard by the committee.

For an account of peace treaties signed between the United States and South and Central American countries, see the article **INTERNATIONAL ARBITRATION**.

EUROPEAN WAR. On the outbreak of the European War (see **WAR OF THE NATIONS**) a proclamation of neutrality was issued by President Wilson, and on the same day, August 18, he issued to the people of the United States a notable address pointing out the proper attitude to be observed by American citizens toward the contending countries.

The United States government undertook to represent Germany in Russia, France in Austria-Hungary, and Austria-Hungary in France. It also looked after British affairs in Germany and Austria, and Japanese affairs in Germany. The President designated October 4 to be in the United States a day of prayer for peace.

The repeated seizure and search of American vessels by naval forces of Great Britain resulted in the dispatch of a long note on December 27. In this note protests were made against the detentions and seizures of cargoes and it was pointed out that the British policy was directly responsible for the depression in many American industries, and that after five months of war there had been no improvement in the situation. For a discussion of the relief undertaken by the United States government and its citizens in behalf of the afflicted countries in Europe, see the article **RELIEF FOR WAR VICTIMS**. On November 16 Turkish batteries at Smyrna fired upon a launch from the United States battleship *Tennessee*, which attempted to land in that harbor. Threatened difficulties between the two governments were reverted by the explanation of the Turkish government that the shot was intended merely to warn the launch away from a mine field. On December 24-25 the one hundredth anniversary of the signing of the Treaty of Ghent, which ended the war between Great Britain and the United States, was observed in the United States, England, and Canada. Relations with Asiatic countries were friendly during the year. No positive action was taken in the matter of adjusting conditions between the United States and Japanese governments resulting from the passage of the alien land laws of California and other States. There was an exchange of communications between the State departments of the two governments during the year, but no definite solution was attempted.

UNITED STATES DEPARTMENT OF AGRICULTURE. In 1914 Congress gave Secretary Houston authority "to prepare a plan for reorganizing, redirecting, and systematizing the work of the Department of Agriculture as the interest of economical and efficient administration may require." A committee of officers from various bureaus studied the department's work and organization. Its report, with some modifications, was approved by the secretary and recommended to Congress for adoption. The retention of the existing bureau organization is favored, with certain rearrangements. Within the bureaus there is to be a more definite segregation of the work in three groups, (1) regulatory, (2) research, and (3) extension work. A number of lines of work are to be transferred from one bureau to another. The farm management studies of the Bureau of Plant Industry, which involve work along all branches of agriculture

with special reference to their economic bearings, will be attached to the office of the secretary. The soil fertility investigations of the Bureau of Soils will go to the Bureau of Plant Industry; the poisonous plant investigations of that bureau to the Bureau of Animal Industry, which will also receive the investigations of duck diseases from the Biological Survey; the wood-distillation studies of the Bureau of Chemistry to the Forest Service. The Office of Public Roads and Rural Engineering, receiving the irrigation and drainage investigations from the Office of Experiment Stations and rural architecture from the Bureau of Plant Industry. To the new Office of Markets and Rural Organization are brought from the Bureau of Plant Industry the investigations on farm credit and insurance; from the Bureau of Animal Industry the market milk investigations and in part the poultry and egg investigations. The most radical changes relate to the Office of Experiment Stations. In consequence of the passage of the Smith-Lever Extension Act (see **AGRICULTURE**) a department organization was required to put into effect the cooperative relations in agricultural extension work between the State agricultural colleges and the department as contemplated in this act. It therefore seemed best to bring all the extension work of the department under the supervision of a single bureau, which would supervise both the Federal funds given to the colleges under the Smith-Lever Act and the funds which the department has for extension work under cooperative agreements with the colleges. The Office of Experiment Stations is already closely associated with these colleges through advisory and supervisory relations with their experiment stations, investigations regarding the teaching of agriculture, and studies in home economics. It is therefore appropriate to expand this office into a States Relations Service to represent the department generally in its relations with the State Agricultural colleges. This Service will include the office of experiment stations, limited to relations with the stations; an office of agricultural instruction; an office of home economics, and two offices of extension work. The latter offices will have the supervision of the Smith-Lever funds, combined with the administration of the funds for farmer's cooperative demonstration work transferred from the Bureau of Plant Industry. The present arrangement by which one of these offices supervises the extension work in 15 Southern States while the other does similar work in the remaining States will be continued.

The appropriations for the department for the year ended June 30, 1914, amounted to \$17,986,945 for ordinary expenses, in addition to permanent and special appropriations and balances from prior years amounting to \$12,225,885, making a total of \$30,212,832. About \$2,440,000 was received from the sale of timber on the national forests, grazing permits, condemned property, etc. The department continued cooperation with the Postmaster-General in the improvement of selected mail-route roads for which Congress appropriated \$500,000, conditioned on the raising of double that amount by the States in which such roads are located. The appropriations for the year ending June 30, 1915, for ordinary expenses amounted to \$19,865,832. The increased allotments are distributed throughout

the department, including many lines of research and a larger amount of demonstration work. The administrative and regulatory functions of the department continue to absorb about two-thirds of the total appropriations.

In 1914 the department published 1152 documents, aggregating 26,691,692 copies. There were 16,061 employees on July 1, 1914, of whom 3226 were employed in Washington. The number of women employed was 1821. Dr. B. T. Galloway, Assistant Secretary of Agriculture, left the department Aug. 1, 1914, to become director of the New York State College of Agriculture at Cornell University and was succeeded by Carl Schurz Vrooman of Bloomington, Ill.

UNITED STATES MILITARY ACADEMY. During the months of June, July, and August, 1914, 214 candidates were admitted as cadets of the Academy, bringing the total strength of the corps, on September 1, to 671. The superintendent and commandant in 1914 was Col. Clarence P. Townsley of the coast artillery corps. The military staff included Capt. George Vidmer, adjutant of the Military Academy and of the Post; Maj. Edward J. Timberlake, quartermaster of the Academy and of the Post; Maj. Peter Murray, treasurer of the Academy; and Lieut.-Col. Henry A. Shaw, surgeon.

UNITED STATES NATIONAL MUSEUM. The growth of the museum during recent years has been greater than during any period of its history, as with the completion of its new building it has been able to expand its collections. During the fiscal year 1914 there was added a total of 337,705 objects, 14,879 of which pertained to anthropology, 257,816 to zoölogy, 44,675 to botany, 3648 to geology and mineralogy, 13,045 to paleontology, 2930 to textiles and other animal and vegetable products, 505 to mineral technology, and 207 to the National Gallery of Art. Among the most important accessions in ethnology were more than 500 objects from Dutch New Guinea, the Moluccas, and Ambon of the Ceram group, collected and presented by Dr. W. L. Abbott. The collection of fine arts was added to by further gifts from Mr. Charles L. Freer, of Detroit. During the fiscal year 14,564 specimens were distributed to schools and colleges throughout the country. The total attendance of visitors to the new or natural history building during the year was 267,728 for week days and 61,653 on Sundays, while the older building was visited by 146,533 persons. The publications of the year numbered 14 volumes and 58 separate papers. The museum forms a part of the Smithsonian Institution. The assistant secretary in charge is Richard Rathbun.

UNITED STATES NAVAL ACADEMY. The total number of students enrolled in the Academy in the autumn of 1914 was 940, and the faculty numbered 125. There were no special changes in the faculty during the year. The superintendent is Capt. W. F. Fullam, the secretary, Mr. P. H. Magruder, and the commandant of midshipmen, Capt. G. H. Burrage.

UNITED STATES PUBLIC HEALTH SERVICE. See PUBLIC HEALTH SERVICE.

UNIVERSALISTS. The estimated number of communicants in this denomination in 1913 was 51,716, with 709 churches and 702 ministers, the Sunday schools containing about 50,000 pupils. Foreign missionary work is carried on in Japan and China. Social work is carried on

by the Commission on Social Service, organized in 1910, which has engaged in a campaign of education to stimulate interest in the subject among ministers, divinity students, men's clubs, women's societies, and young people's societies. The commission also secures the discussion of social service topics at church gatherings and the exchange of social service information through the church press. The institutions of higher education include Tufts College, at Medford, Mass.; St. Lawrence University, at Canton, N. Y.; Buchtel College, at Akron, Ohio; and Lombard College, at Galesburg, Ill.

UNIVERSITIES AND COLLEGES. EUROPEAN. Attendance. The following table shows the attendance in the principal European universities for the years indicated.

* Estimate based upon the latest available report.

AMERICAN

ATTENDANCE. For the year 1912-13, 596 universities, colleges, and technological schools reported to the United States Bureau of Education. These institutions enrolled 190,147 collegiate, 12,084 resident graduate, and 36,869 professional students. There were in addition 38,185 students of music, art, oratory, business, and like courses who were not enrolled in four-year courses leading to collegiate degrees. The proportion of women among the undergraduate students remains at about 36 per cent. There is a slow but steady increase in the per cent of women among the graduate students. In 1912-13 it reached 31.6 per cent. The proportion of women in our higher institutions is very large when compared with the European countries. Germany and Italy each had about 5 per cent and France 10 per cent women in their universities. There were 145 colleges for men with an enrollment of 37,503 students, and 105 colleges for women with 18,896 students.

No less than 53 different kinds of degrees were granted by the institutions reporting. The Bachelor of Science degree was given to 4781 men and to 1089 women, the Bachelor of Art degree to 7924 men and to 6848 women, and the Master of Arts was given to 1555 men and to 814 women. The Doctor of Philosophy degree was conferred on examination by 44 institutions upon 433 men and 57 women. More than a half of the doctorates were from six in-

stitutions. Columbia University gave 67, Harvard 48, Chicago 46, Yale 39, Cornell 35, Johns Hopkins 32, and the University of Pennsylvania 31 doctorates.

The professors and instructors numbered 16,075 men and 3783 women in the collegiate departments and 6955 men and 92 women in the professional departments.

In the professional schools for theology, law, medicine, dentistry, pharmacy, and veterinary medicine there were 65,585 students in 1912-13. The schools of medicine showed a loss of 1214 students from the previous year. The schools of theology also lost 227 students. The following table presents a summary of the essential facts regarding the students and graduates for 1912-13 in the professional schools.

Class	Schools	Students	Graduates in 1913
Theology	179	10,965	1,977
Law	124	20,878	4,427
Medicine (regular)	94	16,130	3,149
Medicine (homeopathic) ..	10	891	196
Dentistry	48	8,015	1,976
Pharmacy	75	6,165	1,813
Veterinary medicine	22	2,324	638

In view of the apprehension that was felt regarding the influence of adverse economic conditions upon the attendance in higher institutions, it is interesting to note that there has apparently been a marked increase of students in nearly all of the institutions that have reported. *Science* for Dec. 25, 1914, gives the registration returns for Nov. 1, 1914, of 30 institutions of the country. The net gain of students in these institutions over corresponding enrollment for 1913 was 11,330. The same article gives the registration in various departments of the 30 institutions. New York University has the largest registration of medical and school of commerce students and lacks only one of having the largest law school. Syracuse has the largest enrollment of art, of forestry, and of music students. Cornell has the largest number of scientific school students, of agricultural, and of architectural students. The non-professional graduate school and the pedagogical departments of Columbia are largest. The University of California with 1238 college men and 1853 college women has the largest number of undergraduate students.

ANNIVERSARIES. The following anniversaries were observed during the year: The one hundred and fiftieth anniversary of Brown University; the centenary of the Yale Medical School; the seventy-fifth anniversary of the University of Missouri; the fiftieth anniversary of the St. Louis College of Pharmacy, and of the School of Mines of Columbia University; the twenty-fifth anniversaries of Johns Hopkins Hospital School, the North Carolina College of Agriculture and Mechanical Arts, and Teachers College, Columbia University.

THE ASSOCIATION OF URBAN UNIVERSITIES. Municipal colleges are a recent development in the United States. Each year, however, a larger number of institutions come to regard themselves as peculiarly related to the cities in which they are located. In commenting upon the work of such colleges, an editorial in the *New York Evening Post* says: "The institutions thus developing may be regarded as a step in democratizing education. The State universities play their part well; but from the point of view of

the city university, they cannot meet the needs of half our youth. Cincinnati, for example, is in a State which enrolls 7000 students in three State universities, and 20,000 in its other colleges. Yet a recent investigation showed that, but for Cincinnati's free tuition, 1000 of the 1500 resident students in the university could have had no higher education. As they attempt to satisfy a practical-minded democracy, such institutions hold in view vocational requirements. Akron strikes a general note when it remarks that 'as a representative of the new type of municipal institution, the university seeks to develop its units or departments, not in accordance with the historical meaning of the term 'university,' but rather into such schools as may train the high-school graduate in various practical and technical callings.' Finally, they tend to make much of the duty of serving the city directly, and of the advantages accruing from such service. Cincinnati last year held an exposition to show how much she was benefiting city government, schools, industries, and social institutions. Pittsburgh has set itself to fit into, 'the mold which is formed for it by the needs of its constituency.'"

For the purpose of studying the problem of the city in its broadest sense, and the training of men and women for the State, a new organization, called the Association of Urban Universities, has been formed. The first president of the association is President Charles W. Dabney of the University of Cincinnati. Other institutions represented are Universities of Boston, Buffalo, Denver, Rochester, Toledo, the College of the City of New York, James Millikan University, and Reed College.

THE CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. The eighth annual report of the president of the Carnegie Foundation for the Advancement of Teaching covering the year ending June 30, 1913, shows a general endowment fund of \$14,075,000, and a special endowment fund of the division of educational inquiry of \$1,250,000. The income from the general endowment fund was \$694,195.81; the expenditures were \$640,601.38, of which \$600,390.01 was for retiring allowances and pensions, and \$40,211.37 for administration and publication. The income from the special endowment fund was \$44,300.08, and the expenditures \$17,830.39. Twenty-four retiring allowances to professors and nine widows' pensions were granted during the year, making the total number of allowances in force 403. The average of all retiring allowances was \$1703.51. The total distribution from the beginning has been \$2,936,927. Seventy-five institutions are in the accepted list. The Rensselaer Polytechnic Institute was the only institution admitted during the year.

During the year the trustees adopted an important amendment to the rules covering retiring allowances to those professors who elect to teach part time with diminished pay after the age of 65. The amendment is as follows: "In reckoning the amount of the retiring allowance the average salary for the last five years of service shall be considered the active pay. In case a professor agrees with his institution to continue at any time after reaching the age of 65 part-time work for a diminished salary, he may do so, and upon his retirement his allowance shall be computed upon the basis of the last five years of full pay. In the case of his

death in this interval the pension of his widow shall be reckoned upon the same basis." Hitherto the retiring allowance has been based upon the average salary paid for the last five years regardless of what amount of service they represent. The report states that "not infrequently it happens that such a man, by concentrating his energies upon a smaller number of courses, may, from his long experience, render most useful service. The rules of the Foundation, as they were framed hitherto, made it practically impossible for this arrangement to go into effect without correspondingly reducing the amount of the teacher's pension. A professor was, under the rules, obliged either to continue full duty or to retire altogether."

The president discusses many other matters such as the foundation of the Division of Educational Enquiry, the Vermont Survey, the Status of Legal Education, the Decreasing List of Medical Schools, and certain New Pension Systems. Part II of the report deals with current educational problems. In a section entitled "The Evolution of College Entrance Requirements" the president calls attention to the need for further improvement by showing that only 55 per cent of the students now in our colleges are high school graduates. Politics and education in Iowa receive thorough treatment. In a section entitled "Improvements in the Financial Status of College Teachers" the salary of the full professor in the institutions associated with the Foundation is shown to be \$3000. During the last five years the salaries of instructors have risen by about \$80. Those of junior professors show a gain from \$120 to \$225. Those of full professors show an increase from \$125 to \$350.

The last section of the report is a frank criticism of contemporary college catalogues. The report says that "It is not too much to say that if the 1000 and more colleges of the country were judged upon the basis of the literary excellence, the clearness, and the honesty of their catalogues, the showing would be an extremely embarrassing one. . . . The time has come when those colleges which value their own scholarly standing and believe that they are offering only sincere and fruitful courses of study should give this matter earnest attention."

CHANGES IN UNIVERSITY ADMINISTRATION. On Jan. 6, 1914, the corporations of the Massachusetts Institute of Technology and of Harvard University ratified an agreement which established coöperation between the two institutions. The University of Pennsylvania School of Medicine admitted women for the first time in September, 1914. The merger of the Starling-Ohio Medical College with the Ohio State University became effective in September, 1914.

FOREIGN STUDENTS AT AMERICAN UNIVERSITIES AND COLLEGES. An investigation conducted by the United States Bureau of Education shows that there were 4222 foreign students in attendance at 275 different universities and colleges in the United States in 1913. New York had 697 of these students in 19 different institutions, Pennsylvania had 506 students in 22 institutions, and Massachusetts 422 students in 15 institutions. Foreign students are to be found in all the States except Delaware, Oklahoma, Wyoming, Arizona, and Idaho.

The largest group of these students was study-

ing Arts and Sciences. The total in these courses was 1700. Engineering with 801 students is the second most popular subject, then follows medicine with 339 students, dentistry with 303 students, agriculture with 275 students, and theology with 256 students.

There are representatives of 51 foreign countries, not counting the dependencies of the United States. Those sending the largest contingents, together with the number of students credited to each, follow: Canada, 653; China, 594; Japan, 336; Mexico, 223; Great Britain and Ireland, 212; Cuba, 209; India, 162; Finland, 124; Germany, 122.

It is interesting to note that the State universities and university schools of France had, on Jan. 15, 1913, 5559 foreign students. In the 21 German universities, during the winter semester of 1914, there were 4427 students from other European countries, and 588 students from other countries. From North and South America there were 348 students.

THE GENERAL EDUCATION BOARD. The General Education Board was founded by John D. Rockefeller, to promote education within the United States, "without distinction of race, sex, or creed." On Jan. 1, 1915, the board made public the first detailed report of its work during the 12 years of its existence. The following extracts from the board's advance announcements indicate the character and scope of work undertaken:

"At the present time the board's resources are valued at \$33,939,156, of which \$30,918,063 is general endowment and \$3,021,093 reserve fund. The gross income from these funds for the year 1913-14 was \$2,417,079.62. In addition the Anna T. Jeanes Fund of \$200,000 yielded a gross income of \$9231.64.

"The administration of these funds is in the hands of a board consisting of Frederick T. Gates, chairman; Walter H. Page, American ambassador in London; J. D. Rockefeller, Jr.; Albert Shaw, editor *Review of Reviews*; Wallace Butterick; Starr J. Murphy; Edwin A. Alderman, president University of Virginia; Hollis B. Frissell; Harry Pratt Judson, president University of Chicago; Charles W. Eliot, emeritus president Harvard University; Andrew Carnegie, Edgar L. Marston, Wickliffe Rose, Jerome D. Greene, Anson Phelps Stokes, Abraham Flexner; and George E. Vincent, president University of Minnesota.

"Up to June 30, 1914, the board had appropriated directly \$15,894,355. Out of funds held by the board 'to be applied to such specific objects within the corporate purpose of the board' as Mr. Rockefeller or Mr. John D. Rockefeller, Jr., might direct, the following gifts have been made:

(a) To the University of Chicago	\$18,554,848.99
(b) To the Rockefeller Institution for Medical Research	10,267,022.10
(c) To the General Education Board	1,239,330.38
	<hr/> \$25,061,196.47

"Thus the total benefactions already distributed to outside institutions through the medium of the General Education Board have amounted to \$39,715,720.

"The board's appropriations up to June 30, 1914, have been as follows:

Colleges and universities	\$10,582,582.80
Medical schools	2,670,874.11
Negro colleges and schools	699,781.13

Miscellaneous schools	159,991.02
Professors of secondary education	242,861.09
Southern Education Board	97,126.23
Rural School agents (both races)	104,448.18
Farm demonstration work—South (including boys' and girls' clubs)	925,750.00
Farm demonstration work—Maine and New Hampshire (including boys' and girls' clubs)	50,876.45
Rural organization work	37,166.66
Educational conferences	18,108.23
Administrative expenses	304,794.99
Total	\$15,894,355.89

"The gifts of the General Education Board to colleges and universities are invariably part only of the sum which the institutions in question have undertaken to raise.

"Up to June 1, 1914, the General Education Board made contributions to 103 colleges and universities; to 19 of these it has made a second appropriation. The sums pledged by the board amount to \$10,582,591.80; the institutions assisted have themselves undertaken to raise additional sums aggregating almost \$40,000,000.

"The appropriations by geographical sections were as follows:

	<i>Appropriations of Board</i>	<i>Entire sum to be raised</i>
To Southern States	\$ 3,052,625	\$12,199,677
To Western States	3,967,781	19,374,522
To East. and Md. States ..	3,562,185	18,810,124
Totals	\$10,582,591	\$50,384,323

"Through the activities of the General Education Board, therefore, \$50,384,323 will shortly have been added to college and university resources. Nor does this sum represent the full outcome of the board's work in this direction, for it does not include bequests written into the wills of those whose interest in a particular institution was first aroused or much deepened by campaigns undertaken to increase endowment.

"A recent report received from institutions which have been assisted discloses the fact that the total increase in the endowment of colleges to which the board has made pledges, determined as from the dates of the several pledges, is already \$20,760,292. The total cost of new buildings for the same period is \$6,302,953.

"It happens very often that the General Education Board is unable to see its way clear to make contributions that have been requested. It is believed that adverse decisions of this kind have as a rule been satisfactorily explained to the applicants, so that, even if the reasons may not be concurred in, the disinterested desire of the board to do justice has not been questioned.

"Decisions of this kind may be based on one or more of several reasons; the board may have already contributed more than a fair share to the section represented; the institution may occupy a more or less unpromising situation; it may be in too close proximity to a stronger institution; it may be without backing; it may be one of several denominational institutions which ought to be merged rather than separately developed.

"Some of these schools may at the moment be performing a useful function; yet unless they appear to be necessary factors in a well-organized and well-distributed permanent system of higher education, the General Education Board is compelled to pass them by."

A section of the report deals with aid for negro education. It says in part:

"Between 1906 and 1912, 74 schools in Alabama were thus aided; toward buildings and equipment, costing \$54,153, the Jeanes Fund of the General Education Board contributed \$18,888; negro patrons of the schools, \$35,265; toward \$17,690 spent in maintenance in the year 1910-11, the Fund gave \$1068, county boards \$9070, and negro patrons \$7552.

"At the present time schools are fortunate if they obtain as principals and teachers the graduates of one of the better industrial schools for negroes. The General Education Board has therefore assisted some of the more efficient of these industrial training schools as follows:

Hampton Institute	\$188,000.00
Tuskegee Institute	135,483.48
Spelman Seminary	196,912.88
Other institutions	85,384.77
Total	\$555,781.13

"With the same end in view, gifts toward improved physical equipment have been made to a number of secondary schools owned or controlled by negroes themselves."

Separate sections of the report deal with girls' canning and boys' corn clubs, and with the educational work carried on among the farmers of the South, an activity which has now been taken over by the Federal government.

GIFTS AND ENDOWMENTS. Among the noteworthy gifts announced by institutions during 1914 were the following: The Boston School of Medicine for the establishment of a maternity hospital, \$100,000; Bowdoin College, \$500,000 from the estate of Edwin B. Smith; The Catholic University of America, the greater part of the estate of \$1,000,000 left by Theodore B. Basselin; Columbia University, \$135,750 from W. K. Vanderbilt for the purchase of land adjoining the university property; Cornell University, \$160,000 from an anonymous giver, for building dormitories; the will of Albert D. Hermance provides a trust fund of approximately \$500,000 for the maintenance of graduates of the Williamsport, Pa., high school at Cornell University; Lafayette College, \$100,000 by the will of William Runcle; Lehigh University, about \$800,000 from the estate of Asa M. Packer; Massachusetts Institute of Technology, \$200,000 by the will of Caroline L. W. French; Northwestern University and Wesley Hospital, \$1,000,000 from James Deering to make the hospital a teaching hospital under Northwestern University; Oberlin College, \$125,000 from an anonymous giver for the building of a new art building; the University of Pennsylvania, \$200,000 from the estate of William B. Irvine; the University of Illinois, land valued at \$200,000 by Capt. Thomas J. Smith; the University of California, \$615,750 from various givers for building a new teaching hospital for the University of California Medical Department; St. Louis University Medical School, by the will of James Campbell, his entire estate after the death of his heirs, who have a life interest in it. The present value of the estate is estimated to be from \$15,000,000 to \$40,000,000. Yale University announced the following gifts: \$350,000 to develop the divinity school; \$500,000 under the will of Lord Strathcona and Mount Royal; \$400,000 by the Lauder family for Yale Medical School. The Medical School of Western Reserve University receives by the will of Liberty E. Holden a bequest estimated to be nearly \$1,000,000. Teachers Col-

lege, Columbia University, will receive \$500,000 by the will of Grace H. Dodge.

Wellesley College completed one of the most important endowments of the year. In 14 months the college raised \$2,430,000. Baker University completed an endowment fund of \$500,000; Central College, Fayette, Mo., increased its productive endowment by \$300,000. Grinnell College raised \$500,000; and Gustavus Adolphus College completed an endowment fund of \$250,000. See also GIFTS AND BEQUESTS.

NEW INSTITUTIONS AND DEPARTMENTS. Mr. Asa G. Chandler gave \$1,000,000 and the citizens of Atlanta guaranteed \$5,000,000 more for the establishment of a new Atlanta University under the auspices of the Methodist Church. The Sheffield Scientific School of Yale University announced two gifts of \$100,000 each for the development of a graduate course in preparation for business and business administration. The University of Pennsylvania formally opened a new School of Education with 45 professors and instructors.

NEW PRESIDENTS. An unusually large number of college presidents were elected during 1914. Among them are the following: John Carey Acheson, LL.D., president of Kentucky College for Women, was made president of Pennsylvania College for Women; Dr. William O. Allen of Drury College, Springfield, Mo., was elected president of Doane College, Crete, Neb.; Dr. William Waddell Boyd was elected president of the Western College for Women, Oxford, Ohio; Dr. M. A. Brannon, professor of biology in the University of North Dakota and dean of the College of Liberal Arts, was elected president of the University of Idaho; Dr. A. R. Brubacher, superintendent of schools, Schenectady, was elected president of the Albany Normal College; Dr. Hermon Carey Bumpus, business manager of the University of Wisconsin, and formerly director of the Museum of Natural History, was elected president of Tufts College; Prof. William Spenser Currell of Washington and Lee University was elected president of South Carolina State University; Dr. E. A. Fath, director of Beloit College Observatory was elected president of Redfield College, Redfield, S. Dak.; Dr. Frank J. Goodnow, Eaton professor of administrative law and municipal science at Columbia University, was elected president of the Johns Hopkins University; Dr. Oscar J. Johnson was elected president of Gustavus Adolphus College, St. Peter, Minn.; Dr. Thomas H. MacBride, professor of botany, was elected president of the Iowa State University; Dr. Henry Noble MacCracken, professor of English at Smith College, was elected president of Vassar College; Dr. John Henry MacCracken, syndie and professor of politics in New York University, was elected president of Lafayette College; Dr. Sidney Mezes, president of the University of Texas, was elected president of the College of New York; Elwood C. Perisho, dean of the College of Arts and Sciences of the University of South Dakota, was elected president of State College of Agriculture and Mechanical Arts at Brookings, S. Dak.

RESOURCES. The total income of the universities, colleges, and technological schools for the year 1912-13 was \$109,590,855 derived as follows: For tuition and other educational services, \$20,919,176; for room rent, \$2,150,555; for board, etc., \$6,993,560; from productive funds,

\$16,569,808; from State and municipal appropriations, \$19,049,823; from the United States government, \$5,443,210; from private benefactions for increase of plant, \$4,476,581, for endowment \$16,045,474, for current expenses \$4,129,903; from all other sources, \$7,941,211. Six institutions reported gifts above \$1,000,000 received during 1912-13. They were University of California, \$1,245,962; Yale University, \$1,418,936; University of Chicago, \$1,307,928; Massachusetts Institute of Technology, \$1,071,608; Columbia University, \$1,421,804; and Trinity College, \$1,203,145. The productive funds of all the institutions amount to \$350,038,287. Six of the leading colleges for women—Bryn Mawr, Mt. Holyoke, Radcliffe, Smith, Vassar, and Wellesley—had a total endowment of \$8,661,841 in 1912. It is noteworthy that this is less than the endowment of Cornell University, less than a half of the endowment of the University of Chicago, and less than one-third of the endowment of Harvard University or Columbia University.

UNIVERSITY EXTENSION IN THE UNITED STATES. University extension teaching is a comparatively new development in the United States. Its beginning is said to have been in 1889 when Teachers College, Columbia University, announced to the teachers of New York City and the adjoining towns the offer of certain elementary courses in science. The first State appropriation for university extension was made by New York in 1891.

According to a bulletin entitled "University Extension in the United States," issued by the Bureau of Education, there are at present no less than 51 institutions of collegiate grade in which extension teaching other than agricultural is to be found. There are in addition 52 institutions with no organized extension work but with teaching along extension lines. The appropriation for extension teaching in 1912-13 was over \$500,000.

At first "the English plan of lectures, class work, syllabi, collateral reading, and more or less rigid examinations conducted by university professors with little if any individual relation" was employed. It was found that these methods were not well adapted to the large part of the student body in America. "As this fact came to be recognized modifications of the original method added correspondence study and class work under less formal conditions." Thirty-two institutions now conduct correspondence courses. All but five of these grant credit toward a degree for work completed by correspondence. That this method of teaching is popular is evidenced by the fact that the University of Wisconsin in 1913 had 5375 students enrolled in such courses while the Pennsylvania State College had 4825, and the University of Chicago 3182 such students.

The enactment of the *Smith-Lever Extension Act* has served to focus attention upon the possibilities of extension teaching. The act was approved by the President, May 8, 1914. It provides for the granting of Federal funds to the State agricultural colleges to aid in diffusing among the people useful and practical information on subjects relating to agriculture and home economics, and to encourage the application of the same. Briefly stated the act provides that each State having an agricultural college shall receive \$10,000. Above this amount the Federal government will under certain conditions

duplicate amounts raised within the State. The first year \$800,000 is appropriated. This \$800,000 will then be increased by \$500,000 for each succeeding year for seven years or until the total annual sum appropriated will be \$4,580,000.

The act defines the uses to which the Federal moneys shall be put as follows: "That co-operative agricultural extension work shall consist of the giving of instruction and practical demonstrations in agriculture and home economics to persons not attending or resident in said colleges in the several communities, and imparting to such persons information on said subjects through field demonstrations, publications, and otherwise; and this work shall be carried on in such manner as may be mutually agreed upon by the Secretary of Agriculture and the State agricultural college or colleges, receiving the benefits of this Act."

In his presidential address before the Association of American Agricultural Colleges and Experiment Stations, Dr. A. C. True said, "The Extension Act has rounded out the Federal legislation providing for the endowment along agricultural lines of the institutions whose establishment was made possible by the Land-grant Act of 1862, not so much by liberal grants of money for extension work as by recognition of such work as a legitimate and necessary function of these colleges which ought to be performed throughout the nation." See also EDUCATION IN THE UNITED STATES.

UNIVERSITY BUILDINGS. See ARCHITECTURE.

UNIVERSITY EXTENSION. See UNIVERSITIES AND COLLEGES under section entitled as above.

UPPER SENEGAL AND NIGER. One of the colonies of the French West Africa government-general. The capital is Bamako, with 7052 inhabitants. Ouagougou has a population of 19,332, Kayes 8952, Ségou 8405, Djenné 6552, Timbuctoo 6699. Cotton cultivation is systematically pursued, and the natives are adepts in the manufacture of cotton textiles. Rice, corn, millet, ground nuts, manioc, tobacco, etc. are grown for local consumption. Rubber and gums are gathered, and the forests abound in valuable timbers. Grazing is carried on, and horses, donkeys, cattle, dromedaries, and ostriches are raised in great numbers. The total imports by the Senegal were valued, in 1912, at 9,803,000 francs, as compared with 17,500,000 francs in 1911; the exports were valued at about 4,000,000 francs—ground nuts 1,100,000 francs, rubber 900,000, gold 600,000, gums 555,000. The trade by way of the Conakry-Kourassa Railway and the Kourassa-Bamako is ascertainable approximately only, being estimated at 1,500,000 francs imports, and 500,000 francs exports. The imports by way of the Saharan frontiers consist chiefly of salt—1,500,000 francs in 1912; the exports, consisting mainly of cereals, textiles, and seeds, were valued at 500,000 francs. Imports by southern routes (Senegal, Guinea, Ivory Coast, and Gold Coast) amounted to nearly 4,000,000 francs, chiefly kola nuts; exports consist of live animals and animal products, and reach an average annual total of about 8,000,000 francs. The railway from Kayes to Koulikoro (553 kilometers) reaches the Niger at Bamako. There is a branch from Kayes to Medine, 12 kilometers; and another, 44 kilometers, connects Kayes with

Ambidedi. The Lieutenant-Governor in 1914 was J. Clozel. See FRENCH WEST AFRICA.

UPTON, WINSLOW. An American astronomer and educator, died Jan. 9, 1914. He was born in Salem, Mass., in 1853, and graduated from Brown University in 1875. He took a graduate course in astronomy at the University of Cincinnati in 1877, and in the same year he became assistant at the Harvard Observatory, remaining in that post until 1879 when he was appointed assistant engineer of the United States Lake Survey. From 1880 to 1881 he was computer at the United States Naval Observatory and was computer and assistant professor in the United States Signal Service from 1881 to 1883. In the latter year he was appointed professor of astronomy at Brown University, and became dean of the university in 1899. He was a member of the United States Eclipse expeditions in 1878 and 1883, and of four private eclipse expeditions—1887, 1889, 1900, and 1905. From the construction of the Ladd Observatory in 1891, he was its director, and was for several years attached to the Harvard Observatory station at Arequipa, Peru. He was the author of *Star Atlas* (1896), and other works of astronomy.

URANIUM. See RADIUM, URANIUM, AND VANADIUM ORES.

URUGUAY. A South American republic, on the Atlantic coast between Brazil and Argentina. Capital, Montevideo.

AREA AND POPULATION. The area of the 19 departments comprising Uruguay is stated at 186,925 square kilometers (72,172 square miles); a recent planimetric calculation, however, makes the area 178,700 square kilometers (68,996 square miles). The census of Oct. 12, 1908, returned a population of 1,042,686 (males, 530,508; females, 512,178); estimate of Dec. 31, 1912, 1,225,914. Of the total in 1908, 861,464 (82.52 per cent) were natives, and 180,722 (17.38 per cent) were foreign-born. The foreigners included 62,357 Italians, 54,885 Spaniards, 27,789 Brazilians, 18,600 Argentines, 8341 French, 1444 Turks and Syrians, 1406 Swiss, 1324 British, 1112 Germans, 1109 Austro-Hungarians, and 636 Portuguese. The department of Montevideo in 1908, with an area of only 664 square kilometers (256 square miles), had 309,231 inhabitants. The population of the city of Montevideo in 1908 was 291,465 (estimate of Dec. 31, 1913, 377,994); Paysandú, 20,953; Salto, 19,788; Mercedes, 15,607; Minas, 13,345; Melo, 12,355; San José, 12,297; Rocha, 12,200; Florida, 10,606; Durazno, 10,597; Rivera, 8986; San Eugenio, 8857; Canelones, 8523; Trinidad, 8317; Colonia, 8021; Treinta y Tres, 7718; San Fructuoso, 7546; Fray Bentos, 7359; Maldonado, 4421. Marriages in 1912 and 1913 respectively numbered 7541 and 7330; births (including stillbirths), 39,171, and 41,778; deaths (including stillbirths), 16,745, and 16,837; stillbirths, 1330, and 1463. Of the living births in 1912, about 28 per cent were illegitimate. In 1911, the reported number of arrivals was 195,386, and departures, 170,922; in 1912, 248,085, and 222,157.

In 1911 there were 934 public primary schools, with an enrollment of 82,441 pupils. There are several secondary, normal, and special schools, and at Montevideo a university with faculties of mathematics, social sciences, law, medicine, veterinary medicine, agriculture,

and commerce. Roman Catholicism is the State religion.

INDUSTRIES AND COMMERCE. Uruguay is a country of much agricultural promise, but the chief source of national wealth at present is the grazing industry, which furnishes in value the great bulk of the exports. The live stock census of 1908 returned 8,192,802 cattle, 556,307 horses, 17,671 mules, 4428 asses, 26,286,296 sheep, 180,099 swine, and 19,951 goats. The number of cattle slaughtered in 1913 for export was reported at 485,806.

The table below shows the area, in hectares, and production, in metric quintals, of cereal crops, linseed, tobacco, and vines in the years 1911-12 and 1912-13, with the average yield per hectare in 1912-13:

	Hectares		Quintals		Qs.
	1911-12	1912-13	1911-12	1912-13	
Wheat	823,244	830,252	2,383,281	1,486,317	4.5
Corn	239,118	254,666	2,022,831	1,357,197	5.8
Oats	84,656	20,411	264,988	126,593	6.2

Vines *	6,116	6,108	105,506	194,805	31.8

* Yield in hectoliters of wine.

In 1913-14, there were under wheat 368,846 hectares, yielding 1,602,277 metric quintals, the average yield per hectare being 4.3 quintals; oats, 39,434 hectares, 268,530 quintals, 6.8 average yield; barley, 5685 hectares, 35,846 quintals, 6.3 average yield; rye, 183 hectares, 1179 quintals, 6.4 average yield; linseed, 51,893 hectares, 244,515 quintals, 4.7 average yield. Neither mining nor manufacturing has attained any considerable development.

Imports of merchandise for consumption and exports of domestic produce have been reported as follows, in thousands of pesos (gold):

	1907	1908	1909	1910	1911	1912
Imports	37,471	87,456	87,157	40,814	44,798	49,880
Exports	34,912	40,841	45,109	41,023	44,537	53,042

Principal classified dutiable imports in 1911, in thousands of pesos: food products, 8513; textiles and manufactures, 8372; iron and steel, and manufactures, 5170; stone, glass, pottery, etc., 4970; woods and manufactures, 2826; beverages, 2139; oils, 1399; chemicals, etc., 1379; tobacco, 1271.

Exported produce of the grazing and meat industry were valued at 36,480,838 pesos in 1908, 40,190,056 in 1909, and 37,814,205 in 1910. Classified exports of Uruguayan produce in 1912 were: produce of the grazing and meat industry, 44,037,038 pesos; agricultural products, 2,051,324; mineral products, 2,189,833; produce of fishing and hunting, 107,691; other, 132,851; ships' supplies, 228,845; increase by market value, 4,294,273; total, 53,041,855. In 1912, the exported produce of the grazing and meat industry was divided as follows: live animals, 1,032,612 pesos; meats and extracts, 5,725,630; grease and tallow, 1,748,912; wool, 25,900,908; hides and skins, 8,089,415; hair and bristles, 217,338; bones and ash, 191,960; other products, 11,249; residuary products, 219,014; total, 44,037,038. The jerked-beef export in 1912 amounted to 38,250 tons, valued at 3,059,984 pesos. Exports of oil-producing grains in 1912 were valued at 886,741 pesos; flour, 862,978;

hay and fodder, 193,686; vegetables and fruits, 100,112.

In 1911, imports from the United Kingdom were valued at 12,162,000 pesos; Germany, 7,591,000; United States, 5,453,000; Argentina, 4,013,000; France, 3,800,000. Exports to France in 1912 were valued at 8,462,632 pesos; Germany, 7,601,810; Belgium, 7,595,643; Argentina, 7,068,494; United Kingdom, 6,294,127; Brazil, 3,659,882; United States, 2,568,057; total, including other countries, increase by market value (4,294,273 pesos), and ships' supplies, 53,041,855 pesos.

COMMUNICATIONS. The length of railway open to traffic at the end of 1912 was 2638 kilometers; under construction, 776 kilometers. During the year application was made to the Uruguayan Ministry for Public Works for authority to survey for a railway starting from Pan de Azucar, crossing the valley of that name and proceeding in the direction of Minas. It was stated that this line would open up the marble and mine stone quarries, and other mineral deposits, and would connect with another line 10 miles long between Pan de Azucar and the port of Piriapolis. Telegraphs in 1912: 57 offices, with 8600 kilometers of wire; radio-telegraph stations, 4, and 7 on board ship. Post offices in 1912, 1129.

FINANCE. The standard of value is gold. The monetary unit is the peso, whose par value is \$1.03424. Estimated revenue and expenditure for the fiscal year 1913 were 35,142,360, and 35,133,812 pesos respectively. The budget submitted to the congress for the fiscal year 1914 showed estimated revenue of 36,597,360 pesos, and estimated expenditure of 36,516,877 pesos. Estimated customs revenue, 17,600,000 pesos. The larger estimated disbursements for the fiscal year 1914 were: on account of public debt, 18,360,042; war and marine, 4,695,162; interior, 3,371,621; public instruction, 3,193,162. Public debt Dec. 31, 1913, foreign consolidated, 118,487,935 pesos; international, 2,190,500; internal, 15,620,423; total, 136,298,558.

ARMY. A small standing army recruited by voluntary enlistment is maintained, where service is from 2 to 5 years with reengagement up to the age of 44. There are 17 battalions of infantry, 4 companies of rifles, 16 cavalry regiments, 3 field artillery regiments of 3 batteries each, a fortress artillery company, a machine gun company, and a bearer company, numbering in all on a peace basis 10,400 officers and men, and capable of being raised to a nominal war strength of 50,000. Service in the national guard or militia is compulsory, being divided into 3 bans or classes, the first embracing all men between the ages of 17 and 30, forming a more or less organized force of 15,000 to 20,000, that could take the field with the standing army. The second ban of men between the ages of 30 and 45 years is the departmental or provincial national guard designed primarily for local service, but its members may be drafted to supply losses in the mobile army in war time. Finally all the men between 19 and 45 form the "territorial" force liable only for garrison duty in their own districts. All three bans have an estimated strength of nominally about 170,000 men. In addition there is a police force with an established strength of 5000.

NAVY. The navy includes one old cruiser

(Montevideo, 1887), of 2200 tons; one torpedo cruiser (*Uruguay*, 1910), of 1500 tons; one gunboat (*18 de Julio*), of 300 tons; one school ship (*Sudrez*), of 300 tons; and three dispatch boats.

GOVERNMENT. The legislative power is vested in the General Assembly, or Congress, consisting of the Senate and the House of Representatives. Senators, 19 in number (one for each department), are elected for six years by indirect vote. Representatives, 90 in number, are elected for three years by direct vote. The president is elected for four years by the General Assembly and is not eligible for the next succeeding term. He is assisted by a responsible ministry of seven members. President for the term ending March 1, 1915, José Batlle y Ordóñez. He was president in 1903-07. President-elect for the term ending March 1, 1919, Blas Vidal.

HISTORY. In the general election of Nov. 30, 1913, the Government party was returned with 69 seats, the Nationalists with 20; and 1 Independent was elected. Neither the Socialists nor the faction of the "Colorado" party opposed to President Batlle y Ordóñez obtained any representation in the new Congress. When Congress was convened in February, 1914, Dr. Blas Vidal was elected President of the Senate, and Vice-President of the republic for one year. In his message to Congress, President Ordóñez declared that Uruguay had successfully weathered the monetary crisis caused by the difficulty of borrowing money abroad. An arbitration treaty was signed with Italy. See also *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties*.

UTAH. POPULATION. The estimated population on July 1, 1914, was 414,518. The population in 1910 was 373,351.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

	<i>Acres</i>	<i>Prod. bu.</i>	<i>Value</i>
Corn ... 1914	12,000	420,000	\$815,000
1913	10,000	840,000	288,000
Wheat ... 1914	291,000	7,275,000	6,256,000
1913	285,000	6,420,000	4,687,000
Oats ... 1914	95,000	4,750,000	2,042,000
1913	90,000	4,140,000	1,656,000
Barley ... 1914	32,000	1,440,000	720,000
1913	30,000	1,155,000	635,000
Potatoes 1914	20,000	2,800,000	1,680,000
1913	20,000	8,600,000	2,088,000
Hay ... 1914	406,000	1,116,000	8,598,000
1913	390,000	909,000	8,272,000

a Tons.

MINERAL PRODUCTION. Utah is unique in the diversity of its mineral production, especially of precious and semiprecious metals. It does not rank first in the production of any of these metals, but it stands well among the leaders in the production of gold, silver, copper, lead, zinc, and vanadium minerals. It ranks second in the production of silver, third in lead, fourth in copper, sixth in gold, and seventh in zinc. The recoverable copper content of the ores mined in Utah in 1913 was 161,445,962 pounds, valued at \$25,024,124, compared with 137,307,435 pounds, valued at \$22,855,735 in 1912. The production of silver decreased in 1913, the recoverable content of the ore mined being 13,084,835 fine ounces, valued at \$7,903,240, compared with 13,835,903 fine ounces, valued at \$8,

509,060 in 1912. The recoverable lead content of the ores mined increased from 70,156 short tons, valued at \$6,314,001, in 1912, to 83,063 tons, valued at \$7,309,579, in 1913. The output of gold declined from 206,360 fine ounces, valued at \$4,265,851, in 1912, to 172,468 fine ounces, valued at \$3,565,229, in 1913. The total value of the metal production in 1913, including a small amount of iron and vanadium ores, was \$44,916,348. The State is an important producer of coal. There were mined in 1913, 3,254,828 tons, valued at \$5,384,127, compared with 3,016,149 short tons, valued at \$5,046,451 in 1912. The output of coal in the State in 1914 is estimated to have fallen off about 10 per cent from the production of 1913. The manufacture of Portland cement is an industry of very recent development in the State. In 1913 the output was 950,469 barrels, valued at \$1,233,421, compared with 760,668 barrels, valued at \$937,119 in 1912. The value of the clay products, exclusive of pottery, declined slightly, from \$724,978 in 1912, to \$708,906 in 1913. The total value of mineral products in 1913 was \$53,606,520, compared with \$51,004,942 in 1912. The value of the gold, silver, copper, lead, and zinc in the mines of the State in 1914, according to the estimates of the United States Geological Survey, showed a decrease in value of about \$6,900,000. The total value is estimated at about \$38,000,000. There was an increase in the quantity of lead produced, but decreases in gold, silver, copper, and zinc estimated as spelter. The copper output decreased about 4 per cent, while gold decreased over 7 per cent, and silver more than 10 per cent. Lead showed an increase of over 9 per cent.

TRANSPORTATION. The total railway mileage of main track in the State in 1914 was 2406. During the year 74 miles of main track were constructed. Lines having the longest mileage are the Denver and Rio Grande, 762; S. P., L. A., & S. L., 483; Central Pacific, 273; Oregon Short Line, 242; Western Pacific, 121; and Union Pacific, 75. The total mileage of electric roads in the State was 304. During the year the Southwestern Pacific Railroad Company was incorporated for the purpose of building a railroad from Palisade, Colo., to a point on the Denver and Rio Grande Railroad, to extend southwestward to San Diego, Cal. It will also run a line to the Grand Canyon of the Colorado River in Arizona, with branch lines running north from the same to tap the iron and coal fields of Washington and iron counties in Utah. A bill was also introduced in Congress by the State Representative authorizing the operation by the government of another long railroad.

EDUCATION. The total school population of the State in 1914 was 117,832. The total enrollment was 94,997, with an average daily attendance of 76,659, and there were 1903 female teachers and 701 male teachers. The average salary of male teachers was \$92, and of female teachers \$75 per month.

FINANCE. The report of the State Treasurer for the biennial period 1912-14 shows a balance on hand Nov. 30, 1912, of \$1,661,701. The receipts for the period amounted to \$8,976,625 and the disbursements to \$9,225,368, leaving a balance on hand Nov. 30, 1914, of \$1,412,958. The funded debt of the State on Nov. 30, 1912, was \$1,230,010, and the per capita debt was \$3.62.

The bonded debt of the State amounts to \$2,410,000.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State, with their population in 1914, are as follows: State Mental Hospital, 501; State Penitentiary, 307; Industrial School for Boys and Girls, 141. The cost of maintenance of these institutions in 1913 was \$180,323.

POLITICS AND GOVERNMENT. The State Legislature had no session in 1914, as the sessions are biennial, and the last was held in 1913. Elections were held for United States Senator and representatives to Congress. Senator Smoot was a candidate for reelection, and was renominated in the primaries. He received in the election of November 3, 56,281 votes, compared with 53,128 votes cast for Moyle, candidate of the Democrats and Progressives combined. The total vote cast in this election was 114,766, compared with 112,385 cast in the presidential election of 1912. The Republican vote showed an increase of about 14,000 votes, while the Democratic and Progressive vote showed a falling off of about 9000 votes. The Republicans elected a representative in the first district, and the Democrats and Progressives combined in the second.

STATE GOVERNMENT, 1915. Governor, William Spry; Secretary of State, D. Mattson; Treasurer, J. D. Jewkes; Auditor, L. G. Kelly; Attorney-General, A. R. Barnes; Superintendent of Education, A. C. Nelson; Commissioner of Insurance, Willard Done—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. M. McCarty; Justices, J. E. Frick and Daniel N. Straup; Clerk, H. W. Griffith—all Republicans.

STATE LEGISLATURE, 1913.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Democrats	2	14	16
Republicans	16	31	47
Republican majority	14	17	31

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

UTAH, UNIVERSITY OF. A State institution for higher education, founded at Salt Lake City, Utah, in 1850. The attendance in all departments in the autumn of 1914 was 1041, and the faculty numbered 80. The university is supported by appropriations from the State Legislature, and from the income from Federal funds, the annual income being about \$250,000. There were no notable changes in the faculty during the year. The library contains 38,757 volumes. The president is J. T. Kingsbury, Ph.D., D.Sc.

VACCINATION. See SMALLPOX AND VACCINATION.

VACCINE THERAPY. This method of treating infections, both acute and chronic, was increasingly used during 1914. Among the diseases in which good results are reported are acne, boils, carbuncles, infections of the lymph glands, chronic rhinitis, asthma, hay-fever, bronchitis, empyema, and tuberculosis with mixed infections, all sorts of surgical wounds which do not heal by first intention, pyogenic joint infections, whether acute or chronic, and enteritis and kidney and bladder infections. Gilchrist gives the results of six years' experience with vaccine treatment of skin diseases, comprising in all about 800 cases. While his results have been variable, and he considers it still necessary

to pay careful attention to diet and other recognized means of cure, he believes that vaccine therapy constitutes a decided advance in the treatment of many stubborn skin diseases, particularly in cases of relapsing furunculosis, sycosis vulgaris, pustular dermatitis, and folliculitis. Gilchrist has also used ointments embodying vaccine elements successfully, as there seems to be a localized immunity under their use. Certain vaccines, such as that against typhoid fever, have great prophylactic value, but slight curative effect. This appears to be the case in whooping cough. The germ associated with whooping cough is the Bordet-Gengou bacillus, and vaccines made from it, whether autogenous or stock, appear, according to Hess, who treated an epidemic of pertussis in a large infant asylum, to confer a measurable amount of immunity against the disease, but offer no appreciable advantages over the present methods of treatment. Other observers report a decrease in the severity and the duration of the disease under the vaccine treatment, but urge that larger doses should be used than previously given.

VAGRANCY, PATHOLOGIC ASPECTS OF. A study of about 2000 vagrants seeking shelter in the New York Municipal Lodging House threw an interesting sidelight on the question as to whether vagrants are the victims of economic conditions or are, on account of mental or physical handicaps, unfit for work. The common impression is that a great many of the vagrants of large cities become such on account of advancing years or economic changes. It was found, on the contrary, that the majority of men applying for lodging were young, 5 per cent were under 21, only 6.85 per cent over 60. It was found, moreover, that even in New York, the gateway of immigration, the foreign-born did not figure largely among the vagrants; also that there was no remarkable preponderance of vagrants drifting in from country districts. Of the 2000 men examined, only 2 per cent had been in this country less than 3 years, the average residence in the city being 32 years and 4 months. As 36 was the average age of the men altogether, the mass might be considered to have lived practically all their lives in the city. Continuing the report declares that 35 per cent of vagrants were unemployable, 12 per cent were defective mentally, and about the same percentage were infirm from age or handicapped by the loss of portions of their limbs, 10 per cent were habitual loafers and confirmed drinkers who had lost the habit of work, 65 per cent were willing and able to work, but were hampered partly by lack of skill or the fact that they pursued seasonal trades, leaving them out of work for months at a time. Of these men, 50 per cent were excessive drinkers; 30 per cent admitted that alcoholic liquors were the sole cause of their social condition. Besides taking into account alcoholism and mental defectiveness, a great many cases must be due to discouragement and psychasthenia. When out of work many men become depressed to such an extent that they are unable to resume work when the opportunity presents itself.

VALPARAISO UNIVERSITY. An institution for higher education, founded in 1873, at Valparaiso, Ind. The number of students enrolled in all departments in the autumn of 1914 was 5700, and the faculty numbered 209. Ser-

eral members were added to the faculty during the year, including Prof. Earl Price in the department of agriculture; Prof. D. L. Snader in the department of architecture; and Prof. S. E. Shideler in the department of education. The productive funds of the university amount to about \$350,000. The library contains about 15,000 volumes. The president is Henry B. Brown, A.M.

VANADIUM. See RADIUM, URANIUM, AND VANADIUM ORES.

VANDERBILT, GEORGE WASHINGTON. An American capitalist and scholar, died March 6, 1914. He was born in New Dorp, Staten Island, N. Y., in 1862, the son of William Henry Vanderbilt. He was educated by private tutors and at private schools, entering Columbia University when he was 16 years of age, and four years later graduating with high honors. He showed taste for study and from early manhood took a deep interest in fine arts, acquiring a wide reputation as a book lover. Upon the death of his father in 1885 he inherited about \$20,000,000, and when his mother died some years later, he became the owner of the Vanderbilt home on Fifth Av., N. Y. A few years after his father's death he decided to develop the finest country estate in America, and in 1887 began the acquisition of what is now known as the Biltmore estate, near Asheville, N. C. He said that he spent more than \$10,000,000 in purchasing tracts of land, in improvements, and in building a beautiful house and gardens. Mr. Vanderbilt engaged Frederick Law Olmstead, the landscape architect, who laid out Central Park, New York City, to take general charge of the development at Biltmore, with Gifford Pinchot as consulting forester. The estate was ready for occupancy in 1897, and from then until his death Mr. Vanderbilt spent the greater part of his time there. The development of live stock was one of his chief endeavors, and Biltmore was stocked with the finest cattle obtainable. Under Mr. Vanderbilt's direction, the estate was made to pay a return on the investment, and besides developing his own land, he taught the neighboring farmers how to obtain the best possible results from their farms. He cut and sold much lumber for which he obtained high prices, and also conducted a nursery, in 1906 contracting to supply Baltimore with nursery stock, shrubs, plants, and bulbs for its parks.

Mr. Vanderbilt also was interested in various institutions in New York City, giving to the city the Thirteenth Street branch of the public library, and presenting to the New York College for the Training of Teachers its site on Morning-side Heights, adjoining the site selected for Columbia University. The Vanderbilt Gallery in the American Fine Arts Society Building was a gift from him. In 1898 he was married to Miss Edith Stuyvesant Dresser, daughter of Col. George W. Dresser of the United States Engineering Corps. Mr. Vanderbilt was probably the least known personally of the Vanderbilt family, most of his time not devoted to the development of his estate being given to study and to collecting books and pictures.

VANDERBILT UNIVERSITY. An institution for higher education, founded at Nashville, Tenn., in 1872. The number of students enrolled in the several departments in the autumn of 1914 was 1112, and the faculty num-

bered 142. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds amounted to about \$1,550,000, and the yearly income to about \$150,000. The library contains 53,000 volumes. The president is J. H. Kirkland, LL.D., D.C.L.

VAN GOGH. See PAINTING AND SCULPTURE.

VASSAR COLLEGE. An institution for the higher education of women, founded at Poughkeepsie, N. Y., in 1861. There were enrolled in all departments in the autumn of 1914, 1120 students, and the faculty numbered 121. James M. Taylor, D.D., LL.D., resigned the presidency in 1914, and was succeeded by Henry N. MacCracken. Frederick A. Saunders, of Syracuse University, was appointed head of the physics department. There was received during the year the sum of \$20,000 for a pavilion in connection with the Swift Infirmary. The productive funds at the close of the collegiate year 1913-14 amounted to \$1,655,257. The library contains about 86,000 volumes.

VATERLAND. See SHIPBUILDING.

VENEZUELA, UNITED STATES OF. A republic lying east of Colombia on the northern coast of South America. The capital is Caracas.

AREA AND POPULATION. The area of the 20 States, two Territories, and the Federal District, as officially estimated, is given below in square kilometers (the area cannot be definitely fixed until the settlement of the boundary dispute with Colombia); the population was calculated in 1909 on the basis of the census of 1891, since which date no census has been taken. The density per square kilometer in 1909 is also shown.

	Sq. km.	1909	D.
Federal District	1,980	118,204	59
Anzoátegui	43,800	184,064	8
Apure	76,500	29,987	0.3
Aragua	5,600	94,994	17
Bolívar	288,000	55,744	0.2
Carabobo	4,650	169,818	86
Cojedes	14,800	87,985	6
Falcón	24,800	189,110	6
Guárico	66,400	188,980	8
Lara	19,800	189,624	10
Mérida	11,300	88,522	8
Miranda	7,950	141,446	18
Monagas	28,900	74,508	8
Nueva Esparta	1,270	40,197	82
Portuguesa	15,200	96,045	6
Sucre	11,800	92,020	8
Táchira	11,100	101,709	9
Trujillo	7,400	146,585	20
Yaracuy	7,100	85,844	12
Zamora	85,200	62,696	2
Zulia	65,500	150,776	2
Delta-Amacuro *	40,200	7,222	0.2
Amazonas *	281,700	45,097	0.2
Total	1,020,400†	2,828,527	2.8

* Territory. † 392,976 square miles.

According to an unofficial planimetric calculation, the area is 942,300 square kilometers (363,822 square miles). The population as estimated in 1913 was 2,755,685, a figure which some authorities regard as excessive. The estimated population of Caracas is 73,000, Maracaibo 50,000, Valencia 40,000, Barquisimeto 32,000, Puerto Cabello 14,000, La Guaira 12,000. Marriages in 1912 numbered 9365, births 75,892, deaths 65,729, immigrants 9672, emigrants 7991.

Education, nominally free, is in a very back-

ward condition. Primary schools are maintained by the State, and there are some secondary schools and two universities. It is probable that at least 60 per cent of the inhabitants are entirely illiterate. The majority of the population are Roman Catholics.

PRODUCTION AND COMMERCE. Among the forest products are rubber, balata, copaiba, and vanilla. Cultivated crops include coffee, sugar cane, cacao, and cereals. Though large mineral deposits exist, mining is not highly developed, the unsettled political conditions being inimical to foreign investments. Gold, copper, and asphalt are the only minerals worked in commercial quantities. Imports and exports by countries of origin and destination for 1912-13, with totals for comparative years, are shown in the table below (values in thousands of bolivars):

	<i>Imps.</i>	<i>Exps.</i>
United States	85,408	51,867
United Kingdom	22,971	8,478
Germany	16,577	20,429
France	18,556	35,825
Netherlands	8,658	3,691
Spain	4,800	7,587
Italy	3,784	1,101
Belgium	789	595

The most important articles of import are cotton prints and cotton drill, principally from the United Kingdom. The principal exports are coffee (78,702,000 bolivars in 1912-13), rubber and balata (12,344,000), cacao (12,010,000), hides and skins (11,088,000), gold (6,131,000), aigrettes (1,934,000), copper (1,663,000), asphalt (1,642,000), live animals (1,087,000). There were entered at the ports in the 1912-13 trade 1642 vessels, of 1,548,267 tons. The merchant marine in 1912 included 8 steamers, of 2046 tons net, and 15 sail, of 2432 tons.

COMMUNICATIONS. Inadequate transportation facilities are afforded by railways extending from the coast into the interior, but not connected to form a system. There were in operation in 1911, 925 kilometers. In 1914 it was reported that the new branch line of the so-called Bolivar Railway from Palma Sola to San Felipe was approaching completion. The main line of this system runs from Tucacas to Barquisimeto, with a branch to Aroa, where copper mines are operated with success. It was also reported that the Central Railway was extending its line which runs from Caracas inland and from St. Theresa to Acumara and Ciran, and that the work was in satisfactory progress. Telegraph lines, 7889 kilometers, with 183 stations; telephone lines, 5872 kilometers, with 17,103 kilometers of wire; post offices, 284.

ARMY. There is an active army recruited by voluntary enlistment or impressing, though under the law military service is obligatory between the ages of 18 and 50. The army includes 20 battalions of infantry, each of 400 men, and 7 batteries of artillery, each of 200 men.

FINANCE AND GOVERNMENT. The monetary unit is the bolivar (par value 19.295 cents), and the standard of value gold. In the table below are details of the budget for 1913-14, in thousands of bolivars, with total actual revenue and expenditure in 1910-11:

<i>Revenue</i>	<i>1000 b.</i>	<i>Expend.</i>	<i>1000 b.</i>
Customs	22,916	Interior	12,541
Surtaxes	12,604	For. affairs	1,840
Salt, spirits, etc.	18,200	Finance & debt	13,825
Other	4,508	War & marine	10,942
		Instruction	4,828
		Pub. works	4,454
		Fomento	4,288
		Total ord.	51,728
		Extraordinary ..	499
Total, 1913-14	52,223	Total 1913-14 ..	52,228
Total, 1910-11	48,558	Total 1910-11 ..	52,837

The total public debt stood Dec. 31, 1912, at 181,595,112 bolivars, of which 116,797,370 bolivars were foreign debt at 3 per cent, 2,236,000 foreign debt without interest, 61,098,554 internal consolidated debt at 3 per cent, and 1,463,188 internal debt without interest.

The present constitution, which bears date of Aug. 5, 1909, vests the executive authority in a President elected for four years. The legislative body is composed of a Senate of 40 members and a Chamber of Deputies.

HISTORY. On April 19 Congress elected Defense Minister Gen. V. Márquez Bustillos to the provisional presidency of the republic. General Juan Vicente Gomez, the outgoing President, became commander-in-chief of the army. General Bustillos selected the following cabinet: interior, César Zumenta; foreign affairs, Manuel Díaz Rodríguez; finance, Román Cárdenas; defense, Gen. Castro Zavala; fomento, Pedro Emilio Coll; public works, Luis Vélez; education, Felipe Guevara Rojas. A new constitution, prepared by Congress and promulgated by presidential decree, went into effect June 19. The code of mines was substantially revised, August 1. The government had to cope throughout the year with various rebel "armies." In March, 450 insurgents started a new revolt near Morawhanna. General Jose Manuel Hernandez ("El Mocho") returned from New York to lead an insurrection in Venezuela; in July he was reported as conducting a precipitate retreat toward the border of British Guiana. A readjustment of Venezuela's diplomatic representation in 1914 had the effect of making the minister to the United States also minister to Cuba and Mexico; another minister was accredited to Chile, Argentina, and Uruguay; a third was sent to Ecuador, Peru, and Bolivia; while separate ministers represented Venezuela in Brazil and in Colombia. The Venezuelan minister in Paris was accredited to France, Great Britain, Spain, and Germany. See *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties*.

VERMONT. POPULATION. The estimated population on July 1, 1914, was 361,205. The population in 1910 was 355,956.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

	<i>Acres</i>	<i>Prod. bu.</i>	<i>Value</i>
Corn1914	45,000	2,115,000	\$1,713,000
.....1913	45,000	1,665,000	1,849,000
Oats1914	79,000	3,858,000	1,847,000
.....1913	79,000	3,081,000	1,602,000

a Tons. b Pounds.				

MINERAL PRODUCTION. The mineral production of the State in 1913 was valued at \$9,647,985, an increase of more than \$500,000 over the figures for 1912. Of the total value, over \$9,000,000 was derived from the quarry products—graphite, marble, slate, and limestone. Other mineral products of the State are asbestos, clay wares, and small quantities of copper, gold, and silver, feldspar, mineral paints, mineral waters, sand, gravel, scythestones, talc, and soapstone.

TRANSPORTATION. The total mileage of railroads in the State on June 30, 1913, was 887. The most important lines are the Central Vermont, the Canadian Pacific, the Rutland Railroad, and the Boston and Maine.

EDUCATION. The total school population in 1914 was 79,219, the total enrollment in public schools being 65,137, and the average daily attendance 51,324. The teachers numbered 3100, the average monthly salary of male teachers being \$82.61, and of female teachers \$51.70. In 1912, an Educational Commission was created for the purpose of investigating educational affairs in the State, and to report thereon. This commission called to its aid the Carnegie Foundation, and issued its report on Oct. 15, 1914. (See EDUCATION IN THE UNITED STATES.) This report contains a definite policy for the State and makes recommendations of a most beneficial character.

CHARITIES AND CORRECTIONS. The institutions under State control include the State Prison, at Windsor; House of Correction, at Rutland; Industrial School, at Vergennes; State Asylum for the Insane, at Waterbury; Soldiers' Home, at Bennington; and the Vermont Sanatorium, at Pittsford. There are also 10 hospitals under control of the State. There is no board or commission of State charities in the State.

FINANCE. The report of the State Treasurer shows a balance on hand on July 1, 1913, of \$313,002. The total receipts for the fiscal year were \$3,294,681, and the disbursements \$3,354,962, leaving a balance on hand on July 1, 1914, of \$252,722. The funded debt of the State on June 30, 1913, was \$346,631, composed of special debt obligations to public trust funds. These obligations were to the Huntington fund (now transferred to the school fund), and a State certificate issued to the agricultural college.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in 1914, as constitutional amendments have changed the date of election from September to November, and the legislative session to the following January. Elections were held for Governor, and other State officers, United States Senator, and for representatives in Congress. Senator Dillingham was a candidate for reelection, and was opposed by a nonpartisan candidate, Charles A. Prouty, who also received the support of the Progressives, Democrats, and Prohibitionists. For Governor, the Republicans nominated C. W. Gates, the Democrats H. B. Howe, and the Progressives W. J. Aldrich. In the election of November 3, Mr. Gates was elected, receiving 36,972 votes, com-

pared with 16,191 for Mr. Howe, and 6929 for Mr. Aldrich. Senator Dillingham was reelected, receiving about 35,000 votes, compared with 27,000 for Prouty, the nominee of the other parties. The total vote cast in the election was 62,065, compared with 62,807 for the presidential election of 1912. The Republicans showed a gain of about 13,000 votes, the Democrats a gain of about 1000, and the Progressives a loss of about 15,000. Republican representatives were elected in both districts. The State Senate chosen was solidly Republican, and the House of Representatives was made Republican by an overwhelming majority.

Political interest during the year centred in the work of the educational commission, appointed by Governor Fletcher, and the reorganization of the State courts by the Governor in connection with the movement for simpler justice and revised judicial procedure. The work of adjusting all the laws in the State to the new constitutional amendments pointed to one of the most important sessions ever held by the Vermont Legislature.

STATE GOVERNMENT, 1915. Governor, Charles W. Gates; Lieutenant-Governor, Hale K. Darling; Secretary of State, Guy W. Bailey; Treasurer, Walter F. Scott; Auditor, Horace F. Graham; Attorney-General, Herbert G. Barber—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, George M. Powers; Assistant Justices, John H. Watson, William H. Taylor, Leighton P. Slack, Robert E. Healy; Clerk, ———— all Republicans.

STATE LEGISLATURE, 1915.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Republicans	80	175	205
Democrats	80	80
Progressives	24	24
Republican majority	80	121	151

The representatives in Congress will be found in the article UNITED STATES, section Congress.

VERMONT, UNIVERSITY OF. A State institution for higher education, founded at Burlington, Vt., in 1791. The attendance in all departments in the autumn of 1914 was about 600. There were 100 members in the faculty. There were no notable changes in the faculty during the year. The university is supported largely by appropriations from the Legislature, the annual income being about \$210,000. The library contains about 90,000 volumes. The president is Guy Potter Benton, D.D.

VETERINARY ASSOCIATIONS AND SOCIETIES. See VETERINARY MEDICINE.

VETERINARY MEDICINE. An outbreak of the dreaded foot-and-mouth disease, the sixth to occur in the United States, was the most notable event of the year in the field of veterinary medicine.

FOOT-AND-MOUTH DISEASE. On October 18 the Federal Department of Agriculture learned that cattle in the vicinity of Niles, Mich., were infected, and a quarantine was immediately placed upon the counties of Berrien and Cass, in Michigan, and the two adjoining counties of LaPorte and St. Joseph, in northern Indiana. Before this was done, however, shipments of infected animals had passed through and infected the Chicago stockyards. Shipments from these yards were traced, and animals found affected

with the disease at points in Michigan, Indiana, Ohio, Wisconsin, Pennsylvania, Maryland, New Jersey, Kentucky, Iowa, and Massachusetts. Subsequently points of infection were traced to Montana, Washington, Delaware, New York, Connecticut, Rhode Island, New Hampshire, Virginia, and the District of Columbia.

The disease most unfortunately made its appearance among the purebred stock being exhibited just at this time at the National Dairy Show, which was held in the pavilion near the Chicago stockyards. These animals numbered nearly 800, and though estimated as worth \$2,500,000, were priceless, since they represented the best bred dairy stock in the United States.

The five previous visits of this disease to the United States occurred in 1870, 1880, 1884, 1902, and 1908, respectively. The first three of these were comparatively trifling; those in 1902 and 1908 were more grave, and that of 1914 the most serious and extensive of all.

The outbreaks of 1902 and 1908 were found to have had their origin in contaminated vaccine virus, but at the time of writing the source of the 1914 outbreak has not been positively determined. It is suspected, however, to have been introduced with a material used in tanning that is imported from several countries, since swine owned by employees of a small tannery in Niles, Mich., which uses this material, were the first animals known to have contracted the malady.

Since the disease exists in a great part of Europe, in the Orient, in South America, and other places, there is an ever present danger of its introduction into the United States. In Great Britain the disease appeared in 1912, and again in 1913, but was thought to have been stamped out. In February, however, it suddenly appeared at Birkenhead in cattle imported from Ireland, and other cases followed in quick succession among the shipment. In order to prevent the spread of the disease, 2000 head of cattle and 1000 pigs were slaughtered.

In combating the present outbreak in the United States, prompt and vigorous measures were taken by the Department of Agriculture, working in close cooperation with the State authorities; and near the close of the year Congress provided an emergency fund of \$2,500,000 to carry on the work. A strict quarantine was at once established and maintained, which prevented the shipment of live stock from States in which the disease appeared, and required that such articles as hides, straw, hay, etc., be thoroughly disinfected before being moved. State quarantines prevented intrastate movement of such sources of infection. As in former outbreaks, the policy of purchasing diseased and exposed cattle at an appraised value, slaughtering and burying them, and thoroughly disinfecting the premises, was followed, one-half of their value being paid by the Federal government, and one-half by the State. An exception was made, however, in the case of the purebred stock exhibited at the National Dairy Show, which was rigidly quarantined. The disease spread rapidly among them, but in a benign form, and aside from some 24 calves, only a single fatality resulted. Aided by the approach of winter weather, rapid progress was made in the control of the disease. At the close of December a large area had been released from quarantine, and there was every prospect of an early eradication of the disease.

Among the complications that arose was the discovery that antihog-cholera serum prepared by a large company operating in the Chicago stockyards, was contaminated with the virus of foot-and-mouth disease. This made the tracing of all infected serum necessary, and the closing of all serum plants in the quarantined territory.

One of the most difficult tasks met with in the work was the disinfection of the Chicago stock yards. This necessitated their closing for a week, and the destruction of myriads of pigeons and rats which infested them and might serve to distribute the infection.

HOG CHOLERA. A special appropriation by the United States Congress of \$500,000 for hog cholera work, of which \$50,000 was to be used in regulating the preparation, sale, and importation of viruses, serums, toxins, and similar products intended for the treatment of domestic animals, and thus protect against the use of such as would be dangerous, under strength, or ineffective, was approved Feb. 23, 1914. Experimental areas were selected in 15 States, and approximately \$20,000 will be spent in each. The work consists in the making of surveys, production and use of serum on hogs on infected and exposed farms, sanitation and quarantine work, and in organizing farmers to cooperate with the State and Federal authorities. Extensive demonstration and educational work is also being carried on in territory outside the experimental areas.

DOURINE. A special appropriation of \$100,000 for dourine eradication work was also provided. A large force of inspectors was at once placed in the infected area of western North Dakota and South Dakota, eastern Montana and Wyoming. As many as 1200 samples a day of blood serum drawn from exposed and suspected animals were tested in the laboratory, a total of 51,293 samples having been examined during the fiscal year, of which 2500 gave positive reactions to the complement fixation test for dourine. The animals reacting to this test have been placed in quarantine, and appraised and slaughtered as rapidly as possible.

SPLENETIC, OR TEXAS FEVER, AND TICK ERADICATION. The appropriation made by Congress for the eradication of the cattle tick which transmits the causative organism of Texas fever was increased to \$400,000 for the fiscal year beginning July 1, 1914, from \$325,000 of the previous year. Of this, \$50,000 may be used for live stock demonstration work in areas freed of ticks. In his annual report the chief of the Federal Bureau of Animal Industry states that during the fiscal year ended June 30, 1914, 28,704 square miles were freed from ticks and released from quarantine. The areas released are distributed in 12 States, and vary from 49 square miles in Missouri, to 7910 square miles in Mississippi. In addition to these 12 States, operations are also being carried on in California and Florida. Twenty-one miles of fence were constructed near the Mexican boundary line in order to prevent the infection of territory in Arizona from the ranging or straying of tick-infested live stock into this country from Mexico, and the construction of approximately 55 miles of fence near the southern boundary of California was also completed. In addition to the inspection work and supervision of dippings, educational and demonstration work was carried on.

SCABIES. As a result of the work of eradication of the scab mite carried on by the United States Department of Agriculture in coöperation with State officials, an area of 238,812 square miles in five States was released from the quarantine for scabies in sheep, and 150,659 square miles in seven States from quarantine for scabies in cattle.

TRICHINOSIS. Experiments reported by Ransom indicate that the larvæ of *Trichinella spiralis* in pork quickly succumb to a temperature of 0° F., and suggest the possibility of substituting refrigeration for the microscopical inspection as a preventive measure.

MEASLES. The true measles of food-producing animals are the larval stages of two varieties of tapeworms in man. Experiments in which beef carcasses infested with tapeworm cysts were exposed to a temperature of 12° to 15° F. for six days show the cysticerci to have been killed. As a result, the meat inspection regulations relating to measles have been modified so that slightly infested beef carcasses are now passed for food after a refrigeration for six days at a temperature not exceeding 15° F.

EVENTS. At the Rockefeller Institute for Medical Research a division of animal pathology was established with an endowment of \$1,000,000, and Dr. Theobald Smith appointed as its head. Dr. Simon Flexner, director of this Institute, took advantage of the appearance of foot-and-mouth disease to commence studies of it. A gift of \$50,000 from Mr. James J. Hill was received by the Institute for the study of hog cholera.

NECROLOGY. Dr. Daniel E. Salmon, who organized the Federal Bureau of Animal Industry and served for more than 20 years as its chief, died on August 30 at Butte, Mont. Among the more important achievements during his service with the Department of Agriculture were the eradication of contagious pleuro-pneumonia of cattle, the establishment of animal quarantine stations, the development of the export and domestic meat inspection service, the suppression of an outbreak of foot-and-mouth disease, the discovery of the cattle tick to be the intermediate agent in the transmission of Texas fever and the detection of the causative agent, and the establishment of a quarantine line against Texas fever. Mention should also be made of the death at an early age of Dr. G. L. Y. Ingram, who, working with Dr. F. W. Twort, first succeeded in cultivating the causative organism of John's disease.

Bibliography. Among the works published were the following: E. Abderhalden, *Defensive Ferments of the Animal Organism* (London, 1914); A. Winslow, *Veterinary Materia Medica and Therapeutics* (7th ed., New York, 1913).

VICTORIA. A State of the commonwealth of Australia. The area is 87,884 square miles. The census of April 3, 1911, returned a population of 1,315,551, exclusive of full-blooded aboriginals; estimate of Dec. 31, 1912, 1,380,561. The capital is Melbourne, whose population, with suburbs, was 588,971 in 1911.

The Governor in 1914 was Sir Lyulph Stanley, who arrived in Melbourne, Feb. 23, 1914. The ministry, formed in December, 1913, was constituted as follows: Treasurer and premier, W. A. Watt; attorney-general and minister of railways, Donald Mackinnon; chief secretary, John Murray; minister of education and labor, Sir Alexander Peacock; minister of lands, H. S. W. Lawson; minister of agriculture and of water supply, W. Hutchinson. In 1914 Mr. Watt became engaged in commonwealth politics and surrendered his post at the head of the Victorian cabinet to his colleague, Sir Alexander Peacock, who, in June, 1914, became premier; succeeded Sept. 17, 1914, by Andrew Fisher.

The programme of Mr. Watt's Liberal ministry was declared on Jan. 5, 1914, when the Premier, speaking at EsSENDON Town Hall, announced that (1) the bill for a redistribution of seats in the Legislative Assembly would be abandoned; (2) that a progressive policy would be adopted of spending \$3,000,000 a year on the construction of new railways; (3) that \$2,500,000 would be borrowed for the building of schools; and (4) that the government would strive with especial earnestness for the development of the country by extending irrigation, by constructing railways, by encouraging immigration, by fostering production, and by facilitating the settlement of farmers on the land. A Workers' Compensation Bill was passed by the Legislative Assembly on January 30. For the Australian events in which Victoria participated, see AUSTRALIA.

VILLIERS, JOHN HENRY, BARON DE. Chief Justice of the Union of South Africa, died Sept.

2, 1914. He was born in 1842 at Paarl, Cape Colony, and was educated at the South African College in Cape Town, afterwards studying at the universities of Utrecht and Berlin. In 1865 he was called to the bar by the Inner Temple. He returned to South Africa in the same year and began practice in Cape Town. He became at once successful in law, and soon entered politics. He was elected a member of the Cape Town House of Assembly in 1866 and was appointed Attorney-General in the ministry formed at the Cape in 1872. Within two years he was promoted to be Chief Justice of the Colony, an office which he held until the formation of the Union of South Africa in 1910, when he became Chief Justice for the whole Union. He was made a baron at the time he became Chief Justice of South Africa and held the first peerage granted to a South African.

VIRGINIA. POPULATION. The estimated population on July 1, 1914, was 2,150,009. The population in 1910 was 2,061,612.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		<i>Acres</i>	<i>Prod. bu.</i>	<i>Value</i>
Corn	1914	1,921,000	39,880,000	\$31,898,000
	1913	1,980,000	51,480,000	39,125,000
Wheat	1914	779,000	11,296,000	12,200,000
	1913	780,000	10,608,000	10,184,000
Oats	1914	191,000	2,960,000	1,717,000
	1913	195,000	2,960,000	2,180,000
Barley	1914	11,000	286,000	229,000
	1913	11,000	286,000	200,000
Rye	1914	58,000	754,000	679,000
	1913	58,000	713,000	578,000
Potatoes	1914	112,000	7,280,000	5,606,000
	1913	105,000	9,870,000	7,896,000
Hay	1914	650,000	4,468,000	8,050,000
	1913	750,000	952,000	14,756,000
Tobacco	1914	175,000 <i>b</i>	118,750,000	10,288,000
	1913	200,000	154,000,000	21,406,000
Cotton	1914	45,000	<i>c</i> 24,000	385,000
	1913	47,000	28,000	1,467,000

MINERAL PRODUCTION. The value of the mineral production of the State increased from \$14,995,842 in 1912, to \$17,178,580 in 1913. Virginia ranks relatively high among the States in the variety of mineral substances produced on a commercial scale, but somewhat low on the list in the value of the production. It is the leading State in the production of iron pyrite used in the manufacture of sulphuric acid, and in the production of manganese ore, and is the only State in which rutile is produced. It also ranks first in the production of soapstone, most of which, before being marketed, is manufactured into heat and chemical resisting articles, such as hearthstones, mantels, griddles, sinks, etc. The chief mineral product, however, is coal, which represents something more than 50 per cent of the total value of the mineral production. The output of coal in 1913 was 8,828,068 tons, valued at \$8,952,653, compared with 7,846,638 tons, valued at \$7,518,576 in 1912. The coal production in 1914, according to the estimates of the United States Geological Survey, showed a decrease of about 1,300,000 tons. This was due almost entirely to the decreased demand from the transportation companies, and from the cotton mills in North and South Carolina. The production of pig iron, the value of which is not included in the total mineral production,

amounted in 1913 to 380,508 long tons, valued at \$5,310,167, compared with 328,961 tons, valued at \$4,364,708 in 1912. The production of coke, whose value was also excluded from the total, increased from 967,947 short tons, valued at \$1,815,975, to 1,303,803 tons, valued at \$2,840,275. The value of clay products in 1913, exclusive of pottery, amounted to \$1,705,651. Third in importance among the primary mineral products of the State is stone, of which the chief varieties quarried are granite and limestone. The total value of the quarry products increased from \$877,746 in 1912, to \$1,705,651. In the production of iron pyrite Virginia accounted for more than 50 per cent of the total production of the United States in 1912 and 1913, the figures for 1913 being 148,259 tons, valued at \$587,041. In the value of commercial mineral waters sold, Virginia ranks sixth among the States, producing in 1913, 2,873,288 gallons, valued at \$298,473. Other mineral products include asbestos, barytes, cement, copper, feldspar, gold, gypsum, infusorial earth, mica, millstones, mineral paints, salt, sand and gravel, silver, slate, and zinc.

TRANSPORTATION. The total railway mileage operating in the State on June 30, 1914, was 7401; of this, 3497 was main track. There were about 185 miles of new track constructed during the year.

EDUCATION. The total school population in 1914 was 616,168. There were enrolled in the public schools 427,937, and the average daily attendance was 281,976. The total number of teachers was 11,336, of whom 9383 were females, and 1953 males. The average monthly salary of male teachers was \$60.59, and of female teachers \$44.76.

FINANCE. The report of the Auditor of Public Accounts for the fiscal year ending Sept. 30, 1914, shows a balance in the treasury on Oct. 1, 1913, of \$482,823. The receipts for the year aggregated \$7,797,532 and the disbursements \$7,645,357, leaving a balance on Oct. 1, 1914, of \$635,417. The public debt on Oct. 1, 1913, amounted to \$24,339,289, a reduction of \$305,785 during the year.

CHARITIES AND CORRECTIONS. The State institutions include the Virginia Penitentiary at Richmond; the State Farm at Lassiter post office; the Central State Hospital at Petersburg; the Eastern State Hospital at Williamsburg; the Southwestern State Hospital at Marion; the Western State Hospital at Staunton; the Virginia State Epileptic Colony, and Virginia Colony for Feeble-Minded at Madison Heights; Catawba Sanatorium at Catawba; the Virginia School for the Deaf and Blind at Staunton; and the Virginia School for the Colored Deaf and Blind at Newport News. There are several other institutions supported by the State, but owned and controlled by independent boards. The State Board of Charities and Corrections has control of the jails and almshouses.

POLITICS AND GOVERNMENT. The Legislature met in 1914, as the sessions are biennial, and are held in the even years. On March 11, a woman suffrage amendment was rejected by the House of Delegates. On September 22 an election was held on a measure providing for State-wide prohibition, which was adopted and goes into effect on Nov. 1, 1916. There was no election for Governor or for United States Senator in 1914. Representatives to Congress were voted

for; the Democrats elected representatives in all the ten districts except one. In the ninth a Republican candidate was successful.

STATE GOVERNMENT, 1915. Governor, Henry C. Stuart; Lieutenant-Governor, J. T. Ellyson; Secretary of Commonwealth, B. O. James; First Auditor, C. Lee Moore; Treasurer, A. W. Harman, Jr.; Superintendent of Instruction, R. C. Stearnes; Attorney-General, J. Garland Pollard; Adjutant-General, W. W. Sale; Commissioner of Agriculture, George W. Koiner; Commissioner of Insurance, Joseph Button—all Democrats.

JUDICIARY. Supreme Court of Appeals: President, James Keith; Justices, S. G. Whittle, John A. Buchanan, George M. Harrison, and Richard H. Cardwell; Clerk of the Court, H. Stewart Jones—all Democrats.

STATE LEGISLATURE, 1915.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Democrats	85	92	127
Independents and Republi- cans	5	8	13
Democratic majority	80	84	114

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

VIRGINIA, UNIVERSITY OF. A State institution of higher learning, at Charlottesville, Va., founded in 1819. The enrollment in all departments of the university in the autumn of 1914 was 906, and the faculty numbered 94. There were no notable changes in the faculty during the year, but several noteworthy benefactions were received. Among these latter was a gift of \$6074 from the estate of Dr. Cumberland George Herndon, making the total to date \$14,246; one of \$23,373 from the estate of E. J. Folkes, to endow two scholarships; one of \$41,988 from the estate of Col. James H. Skinner, to establish scholarships of the value of \$250 each; and one of \$40,000 from the Peabody Education Board, to erect an education building. Dr. Bennett Wood Green bequeathed to the university practically his entire estate, which will amount to about \$135,000, to endow two scholarships and the library. The productive funds of the university amount to \$2,089,673, and the income from all sources to \$329,536. The library contains 100,000 volumes. The president is E. A. Alderman, D.C.L., LL.D.

VIRGIN ISLANDS. A group of West Indian islands; a presidency of the Leeward Islands colony (q.v.). The capital and chief town is Road Town, on Tortola; it has 410 inhabitants. Sugar and cotton are grown. The peasants also raise cattle and catch fish. Their trade is almost exclusively with the Danish islands. Total imports, 1912, £10,323 (£9570 in 1911); exports, £7258 (£8852). Tonnage entered and cleared, 13,067. Customs revenue, 1912-13, £1184. Revenue, 1912-13, £4795; expenditure, £4980. There is no debt. Commissioner, 1914, T. L. H. Garvis. See LEEWARD ISLANDS.

VISCONTI-VENOSTA, EMILIO, MARQUIS. An Italian statesman and diplomat, died Nov. 28, 1914. He was born in Milan in 1829, and when a young man became active in the conspiracies against the Austrian government, continuing these activities until in 1859 he was forced to flee to Turin. During the war with Austria in that year he was appointed by Cavour royal commissioner with the Garibaldian forces.

In 1869 he was elected deputy, and later was sent to Paris and London on diplomatic missions. As reward for his successful work he was given a permanent appointment in the Foreign Office and later became Under Secretary of State. He was appointed Minister to Turkey in 1866 and almost immediately afterwards was elevated to the post of Foreign Minister, but the fall of Ricasoli deprived him of his office until 1869, when he was reappointed, holding the post until 1876, during which time he did important work. In 1894 he was appointed Italian arbiter of the Bering Sea question, and two years later again becoming Foreign Minister, his first important work was to improve the relations between France and Italy by negotiating a treaty with regard to Tunis. He resigned in May, 1898, but again accepted the portfolio in May of the following year and held it until 1901, when he ceased to hold active office. As late as 1912, however, he took part in negotiations between Austria and Italy. His foresight and diplomatic ability are among the chief reasons for the possibility of Italy holding her position in international affairs.

VITAL STATISTICS. According to a bulletin of the Census Bureau, the death rate in the registration area of the United States for 1913 was 14.1 per thousand estimated population. In 1912 it was 13.9, in 1911, 14.2. For the years from 1901 to 1905 the average was 16.2; from 1906 to 1910 it was 15.1. There is, therefore, continued improvement, the average for 1911, 1912, and 1913 being 14.06. What these figures mean in actual lives is indicated by closer analysis. The decrease from 16.2, from 1901 to 1905, to 14.1 for 1913, amounts to 13 per cent, or a reduction of one death in every eight. The largest percentage of decrease was in Rhode Island (15.7), followed by New York (12.3), New Jersey (11.2), and Massachusetts (9.6). The State with the lowest death rate is Washington, with 8.5 deaths per thousand population; and following in order come Minnesota, 10.4; Utah, 11.0; and Wisconsin and Colorado, 11.5. The highest rates were in New Hampshire, with 17.1; North Carolina, 16.8; Maryland, 16.2; Vermont, 15.8; Maine, 15.3; and Connecticut, Massachusetts, New York, and Rhode Island, 15.0. The four States which had a colored population of over 10 per cent, Kentucky, Maryland, North Carolina, and Virginia, averaged 15.0, while a group with equal population, but fewer colored, Wisconsin, Washington, Vermont, and Minnesota, averaged 11.5. Among cities of over 100,000 population, Seattle and Spokane led with only 8.4 and 8.9, respectively. Portland, Ore., followed with a rate of 9.5. The highest rates occurred in Memphis, Tenn., 20.8; Richmond, Va., 20.4; New Orleans, 19.9; Albany, N. Y., 19.8; Baltimore, 18.5; Nashville, Tenn., 17.8; Birmingham, Ala., 17.4; Atlanta, Ga., 17.4; and Washington, D. C., 17.3.

Records of the Department of Health, New York City, show that the death rate per annum of children under five years has fallen from 96.5 per 1000 in 1891, to 61.3 in 1901, 43.8 in 1911, and 37.3 in 1913. For the summer months—June, July, and August—the death rate of children under five years of age during the same period was 125.1 per 1000 in 1891, 76.2 in 1901, 46.3 in 1911, and 38.8 in 1913. This reduction was believed to be due largely to the use of pasteurized milk, but doubtless also to other hy-

gienic and sanitary measures adopted as the result of constant agitation, legislation, and the efforts of the health authorities.

INFANT MORTALITY. *Canada.* With a little less than one-sixth the population of New York, Montreal heads the list in Canada in infant mortality. It has three times the mortality per 1000 that New York has. Recent statistics place it at 290 per 1000 births. Brandon comes next with 269; Ottawa, 256; Halifax, 204; Hamilton, 173; Winnipeg, 169; London, 164. By provinces, the deaths per 1000 births were as follows: Manitoba, 149; Ontario, 131; Saskatchewan, 130; Nova Scotia, 111; Prince Edward Island, 104. The new western cities head the list. In June the Toronto Department of Health inaugurated a new branch of its service, known as the Division of Child Hygiene. The appointments are in the hands of the professor of pediatrics in the University of Toronto and the Medical Officer of Health. Toronto in 1914 had a population of 510,000, of which 10,960 were under one year of age, and 21,070 under two years. In 1897 the infant mortality totaled 664, when the population stood at 197,000. During the five years, 1909-13, it has been as follows: commencing with 1909—1410; 1420; 1432; 1584; 1877.

Scotland exhibits the same phenomenon of a falling birth rate as has been reported for England. The rate for 1913 was 25.5 per 1000, the lowest yet recorded, being 28 per cent less than the rate for 1876. The excess of births over deaths was 47,476, being 2903 less than in the previous year, 4487 less than the mean of the natural increases of the preceding five years, and 6199 less than the mean of those of the preceding ten years.

The following statistics as to contagious diseases throughout the world are compiled from the United States Public Health Reports. While in many instances incomplete and misleading, they are the best obtainable:

SMALLPOX. Algeria, 433 cases; Arabia, 26 cases, 9 deaths; Argentina, 2 deaths; Australia, 32 cases, 1 death; Austria-Hungary, 137 cases; Belgium, 9 deaths; Brazil, 4731 cases, 1205 deaths; Canada, 303 cases, 6 deaths; Canary Islands, 28 deaths; Canal Zone, 1 case; Ceylon, 189 cases, 52 deaths; Chile, 13 cases; China, 254 cases, 177 deaths; Cuba, 7 cases, 1 death; Dutch East Africa, 1 case; Dutch East Indies, 2067 cases, 442 deaths; Egypt, 771 cases, 272 deaths; France, 120 cases, 137 deaths; Germany, 25 cases, 3 deaths; Gibraltar, 7 cases, 1 death; Great Britain, 49 cases, 2 deaths; Greece, 137 deaths; Guadalupe, 10 cases, 1 death; Honduras, 6 deaths; India, 866 deaths; Indo-China, 9 cases, 4 deaths; Italy, 9 cases, 2 deaths; Japan, 102 cases, 29 deaths; Mauritius, 1 case; Mexico, 690 cases, 563 deaths; Morocco, "present"; Norway, 30 cases, 7 deaths; Peru, "epidemic"; Philippine Islands, "severe outbreak in Samar Province"; Portugal, 54 cases; Russia, 1064 cases, 358 deaths; Serbia, 166 cases, 54 deaths; Siam, 4 cases, 2 deaths; Spain, 346 deaths; Straits Settlements, 16 cases, 1 death; Sweden, 13 cases; Switzerland, 217 cases, 1 death; Turkey in Asia, 1529 cases, 898 deaths; Turkey in Europe, 166 cases.

PLAGUE. Arabia, "present"; Australia, 5 cases; Azores, 1 death; Brazil, 91 cases, 71 deaths; British East Africa, 36 cases, 21 deaths; Ceylon, 326 cases, 300 deaths; Chile, 37 cases,

25 deaths; China, 3377 cases, 1747 deaths; Cuba, 4 cases; Dutch East Indies, 14,253 cases, 12,272 deaths; Ecuador, 479 cases, 209 deaths; Egypt, 119 cases, 108 deaths; German East Africa, 15 cases, 9 deaths; Great Britain, 9 cases, 3 deaths; Greece, 22 cases, 3 deaths; Hawaii, 4 deaths; India, Jan. 4 to Oct. 17, 1914, 270,242 cases, 226,104 deaths; Indo-China, 1674 cases, 1053 deaths; Japan, 562 cases, 453 deaths; Mauritius, 56 cases, 23 deaths; Morocco, 8 cases, 2 deaths; New Caledonia, 8 cases, 2 deaths; Persia, 1 case; Peru, 521 cases; Philippine Islands, 24 cases, 23 deaths; Portugal, 8 cases, 8 deaths; Russia, 288 cases, 221 deaths; Senegal, 12 cases; Siam, 59 deaths; Tripoli, "present"; Turkey in Asia, 66 cases, 34 deaths; Straits Settlements, 4 cases, 4 deaths; South Africa, 29 cases, 1 death; Venezuela, 2 deaths; Zanzibar, 33 cases, 21 deaths.

PLAGUE IN THE UNITED STATES. Thirty cases in New Orleans from June to September, 1914.

CHOLERA. Austria-Hungary, 767 cases, 208 deaths; Ceylon, 46 cases, 20 deaths; China, 19 cases, 7 deaths; Dutch East Indies, 1545 cases, 1195 deaths; Egypt, 2 cases; Germany, 33 cases, 9 deaths; Greece, 3 cases, 1 death; India, 182,557 deaths; Indo-China, 129 cases, 63 deaths; Philippine Islands, 1332 cases, 884 deaths; Japan, 6 cases, 3 deaths; Persia, 1 case; Russia, 271 cases, 99 deaths; Serbia, "present"; Siam, 289 deaths; Straits Settlements, 2033 cases, 1296 deaths; Turkey in Asia, 49 cases, 29 deaths; Turkey in Europe, 330 cases, 124 deaths.

YELLOW FEVER. Brazil, 85 deaths; Ecuador, 50 cases, 30 deaths; Mexico, 9 cases, 4 deaths; South Nigeria, 9 cases; Togo, 1 case; Trinidad, 2 cases; Venezuela, 6 deaths; West Indies, 1 death. See TYPHOID FEVER.

VOCATIONAL EDUCATION. See EDUCATION IN THE UNITED STATES.

VODKA. See RUSSIA.

VOELKERS, KARL. A German ophthalmologist, died at Kiel in January, 1914. He was born in 1837, became professor of ophthalmology in Kiel University in 1866, and remained in that position until shortly before his death. He published numerous books on his specialty, notably on the mechanism of accommodation.

VOLCANOES. The list of volcanic outbreaks in 1914 included only one or two notable eruptions, of which the most formidable was that of Sakura-jima, a volcano in the Bay of Kagoshima, Japan. The outburst began January 13, with an outpouring of lava and ash which continued for several days and laid waste the greater part of the island of Sakura. As most of the inhabitants were able to effect their escape to the mainland, the loss of life was comparatively small, a few hundred at most. The property damage, however, was heavy. The fall of ash covered Kagoshima, the principal city in the vicinity, and for a time threatened its destruction, but actually inflicted only slight loss. The volcano long had been moderately active, discharging steam from one of its two summit craters, but had shown no very violent manifestations since the year 1779. Slight earthquakes accompanied the eruption.

An unusual event in the United States was the display of activity shown by Lassen Peak, California, which like Shasta and other cones of that section was supposed to be extinct. There have been no evidences hitherto to indicate that the fires were merely dormant. A

cloud of steam and ash began to issue from the summit on May 30, and soon led to the formation of a crater-like depression, plainly marked amid the snow-fields. Periods of activity alternated with quiescent conditions all through the summer; the heaviest discharge of steam occurred on June 8 and July 18, and on the latter date the column rose to a height of 10,000 feet above the peak. At these times it appeared not unlikely that the eruption might develop violent aspects, and such were freely described in the press, but without much basis. The outbreak may be regarded as one of a series that has taken place in the Cordilleran region since the great earthquakes of Alaska and California, of which note will be found in previous volumes of the YEAR BOOK. See also *Volcanic Emanations*, under GEOLOGY.

VOLUNTEERS, NATIONALIST. See GREAT BRITAIN, *History, passim*.

VOORHEES, WILLARD PENFIELD. An American jurist, died June 1, 1914. He was born in New Brunswick, N. J., in 1851, and graduated from Rutgers College in 1871. After studying law, he was admitted to the bar as attorney in 1874 and in 1878 he became a counselor. In 1908 he was appointed a justice of the Supreme Court of New Jersey for a term of seven years. He was a director in several financial institutions and was a trustee of Rutgers College, which conferred the degree of LL.D. upon him in 1910. Judge Voorhees was always much interested in public affairs in New Brunswick, and served in that city as a member of the Board of Water Commissioners.

VROOM, GARRET DORSET WALL. American jurist, died March 4, 1914. He was born in Trenton, N. J., in 1843, and graduated from Rutgers College in 1862. He studied law and in 1865 was admitted to the bar. From 1866 to 1870 he was city solicitor of Trenton and was prosecutor of pleas of Mercer Co. from 1870 to 1873, later serving as Mayor of Trenton from 1881 to 1884. From 1901 to 1913 he was judge of the Court of Errors and Appeals of New Jersey. He was a member of several patriotic societies, and was the editor of: *Revised Statutes of New Jersey* (1877); *General Statutes of New Jersey* (1895); and *New Jersey Law Reports* (vols. xxxvi to lxx).

WADSWORTH, JAMES WOLCOTT, JR. An American public official, elected on Nov. 3, 1914, United States Senator from New York, to succeed Elihu Root. He was born in Geneseo, N. Y., in 1877, the son of Gen. James W. Wadsworth. He graduated from Yale in 1898 and at once engaged in the management of the large farms and estates which belong to his family. In addition to these duties he took an active interest in politics, in 1905 was elected a member of the New York Assembly, serving until 1910, and from 1906 to 1910 he was speaker of the House. He was a delegate to the Republican National Convention of 1908 and 1912. Mr. Wadsworth is one of the youngest men ever elected United States Senator. Although identified throughout his career in New York politics with the more conservative element of his party, he has become well and favorably known as a fearless, high-minded, and aggressive legislator. For details of his election, see NEW YORK.

WAGES. See LABOR; LABOR LEGISLATION.

WAGNER, LOUIS. An American banker and soldier, died Jan. 15, 1914. He was born at

Giessen, Germany, in 1838, and in 1849 he accompanied his family to Philadelphia, where he was educated in the public schools of that city. He learned the lithographing business, but in 1861 entered the Union army. He was promoted through various grades until he became a colonel in 1863 and brevet brigadier general in 1865. In 1862 he was badly wounded at the second battle of Bull Run. He was obliged to retire from active service and was placed in charge of Camp William Penn for the organization of colored troops, in which capacity he sent to the front over 14,000 negro soldiers. After the war he engaged in the insurance business in Philadelphia and became one of the most successful financiers of that city, taking an interest in the city government, and from 1887 to 1891 being Director of Public Works. He was an officer and director in many financial and civic organizations, in 1880-81 being commander-in-chief of the Grand Army of the Republic, and also chairman of the fiftieth anniversary of the Battle of Gettysburg Commission, created by the Legislature of Pennsylvania.

WAINWRIGHT, CHARLES S. An American physician, died May 6, 1913. He was born in Missouri in 1858, and in 1881 graduated from Bellevue College. He made a special study of the heart and lungs at European medical schools, and then went to the University Medical School in Kansas City, Mo., as professor of internal medicine. He became dean of the college, resigning in 1902 to become an instructor in internal medicine at the Post-Graduate Hospital in New York City. He resigned this post after holding it for one year, and retired from active life.

WALDEN, JOHN MORGAN. An American bishop of the Methodist Episcopal Church, died Jan. 21, 1914. He was born in Lebanon, Ohio, in 1831 and graduated from Farmers' (now Belmont) College in 1852. He taught school for several years and then conducted and published an independent paper in Illinois, afterwards being editor of a free-state paper in Kansas. In 1848 he was a member of the Kansas Constitutional Convention, and in the same year he entered the Methodist Episcopal ministry and filled pastorates in various places in Ohio and other States. He served in the Union army in 1862, and in 1864 became editor of the *Daily Advocate*. From 1862 to 1866 he was corresponding secretary of the Freedmen's Aid Commission, and from 1866 to 1868 filled the same position for the Methodist Freedmen's Aid Society. He was one of the publishing agents of the Methodist Western Book Concern from 1868 to 1884, and in the latter year was elected bishop. He was a delegate at many church conferences and made episcopal visits in every State in the Union, and to the Methodist missions in Europe, Asia, South America, and Mexico.

WARMAN, CY. American poet and writer, died April 7, 1914. He was born in Greenup, Ill., in 1855 and was educated in the common schools. For several years he engaged in farming, and was a wheat broker in Pocahontas, Ill. In 1880 he removed to Colorado and for several years was employed as railroad fireman and engineer. He then became editor of the *Western Railway* and edited several other papers in Colorado. He wrote much in prose and verse, but first achieved a national reputation as the author of the popular song "Sweet Marie." He

spent several years in travel in Europe and the Orient. His published writings include: *Tales of an Engineer* (1895); *The Express Messenger* (1897); *Frontier Stories* (1898); *The Story of the Railroad* (1898); *The White Mail* (1899); *Snow on the Headlight* (1899); *Short Rails* (1900); *The Last Spike* (1906); *Weiga of Temagami* (1908); as well as verse and short stories contributed to many magazines.

WAR OF THE NATIONS, THE. Although in America the tremendous armed conflict which began at the close of July has been frequently referred to as the "War in Europe" or the "European War," a less appropriate name could hardly have been invented for a war on whose battlefields in three continents fight soldiers of almost every race. The title employed at the head of this article is preferred, not only because it may be used in Europe as well as in America, but also because it suggests the very significant fact that national sentiment more especially characterizes the belligerent peoples in this than in any previous war. It is truly a War of the Nations, in which the whole fighting strength of each country goes forth to battle inspired by a passionate devotion to the "national honor" or the "national existence" of the "Fatherland" or "la Patrie."

OUTLINE. The various aspects of the war will be discussed under the following captions:

- I. The War in Brief.
- II. Underlying Causes.
- III. Outbreak of the War.
- IV. Military Operations.
- V. Naval Operations.
- VI. Neutral Nations.

I. THE WAR IN BRIEF

By the unparalleled development of national consciousness combined with militarism and imperialism, by the diplomatic grouping of the Powers in two mutually hostile coalitions, and by the conflict of economic interests, the great nations of Europe had placed themselves in so perilous a position that a comparatively trivial occurrence was sufficient to precipitate an almost universal war. (See *Underlying Causes*.) On June 28 the Austrian heir-apparent, the Archduke Francis Ferdinand, was assassinated with his wife at Sarajevo. Accusing Serbia of complicity in the Sarajevo crime, and alleging that the anti-Austrian machinations of Serbian patriots menaced the Hapsburg Empire, Austria-Hungary on July 23 delivered an ultimatum containing demands with which Serbia would only partially comply. Despite diplomatic remonstrances, Austria-Hungary declared war on Serbia, July 28. The beginning of Russian mobilization, and the refusal of Russia to recall the mobilization order, were considered by the German government sufficient cause for declaring war on Russia, August 1. War between Germany and France was begun on August 3. Preparatory to the invasion of France, German troops had already occupied the neutral Duchy of Luxemburg, August 2, and begun to invade Belgium August 4 in spite of Belgium's resistance. The German violation of Belgian neutrality decided the British government to enter the war, August 4. Montenegro joined Serbia against Austria-Hungary, August 8. As Germany refused to surrender Kiaochow, Great

Britain's Oriental ally, Japan, made war on Germany, August 23. Turkey, having purchased two fugitive German warships, bombarded Russian Black Sea ports on October 29; on October 30 a state of war between Russia and Turkey was declared; and on November 5 France and Great Britain declared war on Turkey. Further formal declarations of war between the nations already engaged in hostilities completed the alignment of Serbia, Russia, France, Belgium, Great Britain, Montenegro, and Japan against Germany, Austria-Hungary, and Turkey. The negotiations conducing to this result and the apologies of the various belligerents are reviewed in section III. The military operations of the war, described in section IV, may be briefly summarized as follows: (1) The Austro-Hungarian invasion of Serbia, distracted by counter-invasions, and stubbornly resisted by the Serbian veterans, failed in the second week of December. (2) In the Franco-Belgian theatre, the gallant Belgian defense of Liège and a French invasion of Alsace failed to stop the onward march of German armies through Belgium, Luxemburg, and Lorraine toward Paris. After the battle of the Marne, September 6-10, the German right wing fell back to the Aisne River, where a tremendous but protracted battle was fought, September 15-28. The Belgian stronghold of Antwerp succumbed to German siege-guns on October 9. At the close of the year the Franco-Belgo-British armies faced the German invaders along an intrenched battle line extending from Flanders to Alsace. (3) In the east, Russian armies invaded Austrian Galicia and German East Prussia, while German and Austro-Hungarian forces occupied a portion of Russian Poland. (4) The Turks waged war against Russia in the Black Sea region, and against Great Britain they sent an army to threaten the Suez canal. (5) The Japanese captured the German fortresses of Tsingtao in China on November 6 after a siege of 65 days. (6) The German island possessions in the Pacific were easily taken by British and Japanese forces. (7) In Africa, German Togoland and Kamerun were occupied by Anglo-French troops, and German Southwest Africa invaded by British South Africans, but German East Africa repelled British attacks. In the war on the sea, discussed in section V, no decisive battle was fought as the main part of the German fleet remained in home waters, protected by mines and fortresses. The other sections are self-explanatory. The attitude of Socialists toward the war is discussed under SOCIALISM.

II. UNDERLYING CAUSES

A. NATIONALISM AND MILITARISM. Surprise and indignation have often been expressed that ten nations should be involved in a terrific combat simply because an Austrian archduke and his wife were shot at Sarajevo. In reality the Sarajevo incident was not the cause, but merely the immediate occasion of the war. It is the purpose of this section to set forth a few of the facts of recent history which may show the fundamental causes underlying the war. Among the several causes of the war, first importance must be assigned to the development of national militarism, based on a sentiment of national patriotism. To the twentieth century it is a commonplace that a compact people speaking

the same language and sharing the same historical traditions and social customs should be politically united as a free and independent nation. To the nineteenth century, nationalism was a revolutionary doctrine. At its commencement there was no such German nation, no such Italian nation. Goethe (1749-1832) was proud to be "a citizen of the world." But the all-conquering armies of the French Revolution brought to the disunited nations of Europe a new gospel of Fraternity, that men of the same nation should be brothers-in-arms to defend their liberties against the tyrant and their homes against the foreign foe. Poetry glorified the idea of national patriotism, religion sanctioned it, and political theory invested it with all the finality of a scientific dogma. In the course of the nineteenth century, the spirit of nationalism produced an independent Greece, a Serbia, a Rumania, a Bulgaria, a Norway, an Italy, a Germany. Each nation was proud of its national language, its national customs, its frequently fictitious but always glorious national history, and, above all, of its national political unification and freedom. Not all nations were successful in achieving unity and independence. Ireland was still governed from Westminster; Poland was still divided between Hapsburg, Hohenzollern, and Romanov; Serbia lacked Bosnia; Rumania longed for Transylvania (in Austria-Hungary) and Bessarabia (in Russia). According to the principle of nationalism, Austria-Hungary should have been partitioned, surrendering to Germany the German provinces of Austria, to Italy the Trentino and Trieste, to Serbia Bosnia-Herzegovina, to Rumania Transylvania. Because the integrity of the Hapsburg Empire was thus menaced by nationalism, and because the Russian Orthodox Slavs favored the nationalist aspirations of the Servian Orthodox Slavs, the Austro-Hungarian government felt fear. And fear made the war.

Thus far we have considered simply the nationalist half of national militarism. Most often, during the nineteenth century, the growth of nationalist sentiment was combined with tendencies toward democracy, and foremost patriots were identical with conspicuous democrats. Such, at any rate, was the case in Hungary, in Italy, in France. Such, too, at the outset, was the case in Germany. It will be recalled that the first serious attempt to achieve the political unification of the Germanies was made by the democratically-minded Frankfort Assembly in the stormy days of 1848-49; that it represented a combination of nationalism and liberalism, of the German nation with the German democracy. But this first attempt failed. The second attempt, Bismarck's attempt "by iron and blood," was crowned with success. Bismarck's three wars of 1864, 1866, and 1870-71 solidly established the united German Empire. But they simultaneously cemented the union of nationalism and militarism, of the German nation with the Prussian army. Henceforth national patriotism was to be inseparably associated with large armies. Because the German Empire was born of the Franco-Prussian War (1870-71), the German military writer Bernhardt* could

say: "'War is the father of all things.' The sages of antiquity long before Darwin recognized it. The struggle for existence is, in the life of Nature, the basis of all healthy development . . . it is not only a biological law, but a moral obligation, and, as such, an indispensable factor in civilization." According to this new pseudo-biological political theory, international politics became the "struggle for existence," in which the fit survive. Catching the spirit of the famous German historian Treitschke, General Bernhardt declared Germany the fittest to survive, for, "From their first appearance in history the Germans have proved themselves to be a civilized nation of the first rank, and, one may say, the civilized nation." "Absolutely the most important task of a modern State consists in making its armed force as powerful as possible," says Bernhardt, since war "is fought in the interest of biological, social, and moral progress." The admonition to prepare for war was taken seriously by all nations, but most seriously by Germany. On the continent of Europe monstrous standing armies and universal compulsory military service became the general rule. It is not here the place to dilate on the effect of these armies in handicapping industry, promoting immorality, and increasing taxation; nor is it here pertinent to show the influence of the military aristocracy—which was also the landed nobility ("Junkerdom")—in throttling German democracy. But it is supremely important to recognize that the maintenance of large standing armies, officered by "fire-eaters," in combination with the cynical, pseudo-scientific doctrine that the strong survive, led directly to a rivalry in armaments which inevitably produced war.

The year 1913, the year before the great war, witnessed an unprecedented outburst of national militarism. Germany put all Europe in a panic by preparing an Army Bill whose terms became known in February, 1913. To the peace footing of the German army were added 117,000 men and 19,000 officers, bringing the total strength of the peace army, including auxiliary services, up to 870,000. Immediately the Superior Council of War in France replied to the German challenge by proposing, March 4, that the term of military service be increased from 2 to 3 years, in order to augment the strength and improve the organization of the French army. It should be noted that the German increase was proposed first, that it was approved by the Bundesrat on March 28, and that it was finally passed by the Reichstag on June 30, 1913, three weeks before the French Three-Year Law was passed by the Chamber of Deputies, July 19. Russia, the ally of France, and Austria-Hungary, the ally of Germany, likewise made warlike preparations. In July the Duma authorized a new army budget and the lengthening of military service from 3 to 3½ years; General Joffre, the French commander-in-chief, visited Russia in August, 1913, to confer on the

the General Staff of the Army 1879-81, and continuously since 1886. He became commander of the 16th army corps (1897), major-general (1900), and cavalry general (1908). Now on the retired list, he has remained a conspicuous advocate of militarism and Pan-Germanism. His book—*Germany and the Next War* (1912)—though by no means representative of the opinion of all classes in Germany, attracted much attention abroad as the work of a prominent member of that military caste which seemed to be urging Germany to war.

* BERNHARDT, FRIEDRICH A. J. VON. Born at St. Petersburg, Nov. 22, 1849, the son of a German diplomat, received his early education in Berlin and entered the Prussian army at the age of nineteen, serving throughout the Franco-Prussian War of 1870-71. He was connected with the Military Academy 1878-77, with

reorganization of the Russian army. Austria-Hungary introduced a new scheme whereby her peace army was increased from 463,000 to 560,000; and enormous sums were appropriated for the provision of artillery. Even the smaller states of the Balkan, Iberian, and Scandinavian peninsulas caught the contagion of the army fever. The most ominous feature of all this military preparation was the fear and hatred it inspired. France introduced three-year service because she feared the German army, with its corps at Metz, Saarbrücken, and Strassburg. When little Belgium introduced universal military service and planned to create a field army of 150,000 in addition to garrisons of 130,000 men, the explanation was frankly made that the recent construction of German railways leading to the Belgian frontier, without obvious economic purpose, signified that Germany was preparing to transport troops into and through Belgium in case of a Franco-German war. Similarly Germany was alarmed by the projected construction of new Russian railways, which would facilitate Russian mobilization against Germany. And in the spring of 1914 a veritable panic was created in the German and Austro-Hungarian press by articles in the *Cologne Gazette*, *Germania*, the *Post*, and the *Berliner Tageblatt*, commenting on the Russian preparations, which would be perfected a year or two hence. Bernhardt, in the *Post*, warned Germany to be ready for a war in the near future. On the other hand, the *St. Petersburg (Petrograd) Birshchaja Wjedomosti* on June 13, 1914, declared that, "France and Russia do not desire war, but Russia is prepared, and hopes that France will likewise be prepared." Thus national militarism created the situation out of which grew the War of the Nations—the nations of Europe, armed to the teeth, regarding each other with insane fear, awaiting the inevitable conflict. See article on MILITARY PROGRESS in the 1913 YEAR BOOK, and sections under the various countries.

B. THE WORK OF THE DIPLOMATS. While the War of the Nations was primarily due to the prevalence of the idea that each nation must excel the other in arming for the protection of "national honor," "national existence," or "national prestige," the work of diplomats and statesmen was partly responsible for the catastrophe. Again we must go back to the birth of the German Empire (1871). At that very time when Bismarck was achieving national unification for Germany, he was outraging the national sentiments of France; for, by the Frankfurt treaty of peace (May 10, 1871) at the close of the Franco-Prussian War, he not only aimed to cripple France by imposing an enormous indemnity of 5,000,000,000 francs, but he also gave France an unforgettable grievance by annexing to Germany part of the French-speaking provinces of Alsace and Lorraine. In order to prevent a French war of revenge, Bismarck sought the support of other Powers. In 1872 he cemented the so-called Three Emperors' League between Hohenzollern, Hapsburg, and Romanov. When jealousy came between Russia and Austria-Hungary, Bismarck brought Italy into a defensive Triple Alliance (1882) with Austria-Hungary and Germany. But the intimate alliance of Germany with Austria-Hungary brought trouble in its train. Bismarck himself made possible the military occupation of Bosnia

and Herzegovina—two Turkish provinces inhabited by people of Serbo-Croat or Servian race—in 1878. A later German Chancellor, Von Bülow, by threat of a European war compelled Russia and Servia to allow the Austrian annexation of Bosnia-Herzegovina in 1908. And in 1912-13 Austria-Hungary almost involved Germany in a war to prevent Servia from gaining a seaport on the Adriatic. These three crises showed the solidarity of the Hapsburg and Hohenzollern Empires, but won the undying enmity of the Servians, who felt their national unification to be prevented, and their independence menaced, by Austria-Hungary. Russia, ever anxious to be the patron of her Slavic kinsmen and Orthodox co-religionists in the Balkans, and ambitious to secure her own supremacy in the Near East, became more than ever the antagonist of Austria-Hungary in the Balkans and the enemy of Austria's ally. Thus Germany incurred the enmity of Russia, Servia, and France.

So long as Bismarck, with rare diplomatic talent, prevented France from forming any alliance, the Triple Alliance could dominate the continent and the German military aristocracy could dominate the Triple Alliance. After Bismarck's retirement in 1890, however, less astute statesmen presided in Germany. France was allowed to form a Dual Alliance with Russia (1895) on the basis of mutual hostility to Germany and of Russia's need for French capital in the development of industries, railways, and armament. The second serious blow to German hegemony was the attachment of Great Britain to the Dual Alliance. That Great Britain was able to overcome her historic hatred of France, her fear of Russian ambitions in Asia, and her repugnance for Russian autocracy was due not so much to Edward VII, whose famous visit to Paris in 1904 sealed the Entente Cordiale, as to the remarkable French diplomat Théophile Delcassé,* who with perseverant tact strove to undo Bismarck's work† and with fiery patriotism worked for the aggrandizement of France. Thanks largely to Delcassé's diplomacy, the Russo-Japanese War of 1904-05, between the French ally Russia and the British ally Japan, resulted, not in a rupture of the Franco-British Entente, but in an agreement between Russia and Japan, a settlement of the various Russo-British colonial disputes, and the formation of the Triple Entente, in 1907, including Russia, Great Britain, and France.

More than to any one person, however, the formation of the Entente was due to the appearance of German militarism on the high seas—the construction of the German navy. Taking to heart the lessons of the Spanish-American and Boer Wars, and believing with Captain Mahan that sea-power was essential to a nation's greatness, Germany prepared to challenge the "mistress of the seas." In 1898 Admiral von Tirpitz began his work as Secretary of State for the Imperial German navy; Admiral von Koesler's Navy League redoubled its agitation for a "big navy," and in 1900 Kaiser Wilhelm himself proclaimed that "Germany's future lay upon the water," that "the ocean was essential to

* DELCASSÉ, THÉOPHILE (1852–), member of the Chamber of Deputies since 1889, energetic colonial minister (1892-95), foreign minister (1898-1905), minister of marine (1911), ambassador to Russia (1913), and again foreign minister (1914–).

† For the weakening of Italy's attachment to the Triple Alliance, see section VI.

Germany's greatness." Henceforward the building of German fleets went feverishly forward. Great Britain, accepting the challenge, resolved to maintain a "two-Power standard," which, as subsequently modified, signified the construction of 8 British dreadnoughts for every German 5. Impatient of this ruinous naval competition, the British government more than once offered to limit armaments or to call a halt for a year in naval construction; but Germany scorned the offer. In this connection, it should not be forgotten that Austria-Hungary and Italy, France and Russia were at the same time participating in the naval competition of the rival triple groups.

The balance of power between the rival alliances made Europe abnormally sensitive to the slightest international disturbances. Between 1905 and 1914 five times Europe was brought to the verge of a great war. In 1905 the first Moroccan crisis was caused by the abrupt declaration of the German government that since Germany had not been consulted when, in return for nonmolestation in Egypt, Great Britain had given France a free hand in Morocco, an international conference should be called to discuss the status of Morocco. So menacing was the German Chancellor's attitude, that France was compelled not only to submit her claims to a conference, but also to dismiss her able foreign minister, Delcassé, at Germany's dictation. Three years later, when Russia protested against the Austrian annexation of Bosnia-Herzegovina, the Kaiser declared himself ready to stand "in shining armor" at the side of his ally; and Russia, unwilling to fight Germany, refrained from interfering. In July, 1911, a third war scare was caused by the dramatic appearance of the German gunboat *Panther* at Agadir, ostensibly to protect German interests in Morocco. This time Great Britain's loyal support enabled France to escape lightly, with the cession of 100,000 square miles of the Congo as the price of Germany's permission to stay in Morocco. Again in 1912 Austria-Hungary threatened war if Serbia should annex an Adriatic port; and Serbia refrained. Within six months Austria-Hungary was making warlike preparations to expel the Montenegrins from Scutari. Russia championed Montenegro. But Montenegro had to give up Scutari, May 5, 1913, in order to avert a war between Austria-Hungary and Russia. Perhaps Austria-Hungary and Germany, having so often by a mere threat of war intimidated their rivals, expected that once more the Triple Entente would prefer yielding to fighting, and Austria-Hungary would be able to conquer Serbia while Germany's "shining armor" held Russia in terror. In 1908, in 1912, and in 1913 Russia had been intimidated; in 1914 Russia mobilized. By misjudging the temper of Russia, or else with deliberate intent, the diplomats of Berlin and Vienna precipitated the War of the Nations.

C. ECONOMIC CONSIDERATIONS. Some devotees of the economic interpretation of history have rather rashly asserted that the true reason for the war was a dispute about pigs. Serbia raised pigs, it was explained, and in seeking facilities for the exportation of pork came into conflict with the interests of Austria-Hungary. Although few students of history would accept so crude an hypothesis, it is generally admitted that economic considerations do fre-

quently influence international relations. It is the business of this section to present a few suggestions which may show the trend of those economic considerations. (1) In the German apologies for the war, Great Britain is bitterly accused of envying German prosperity and of welcoming the war as an opportunity to crush German commercial and industrial competition. The strenuous efforts of British business men during the war to capture German trade are cited as proof. The British apologists reply that Great Britain entered the war only after extreme hesitation, after warning Germany not to violate Belgian neutrality; that Great Britain had not welcomed the war, far less caused it; and that the war on German trade was a result rather than the purpose of the armed conflict. (2) On the other side, Germany is accused of waging war for economic aggrandizement. In explanation, let us for the third time refer to the origin of the German Empire. Besides a sentimental yearning for national unity, two factors worked together to weld the many petty German States into a united nation. The spectacular part was played by the Prussian army, under the control of domineering, land-owning aristocrats like Prince Bismarck. Equally important, if less striking, was the work of the industrial capitalists. They had built railways binding the Germanies together with bonds of steel; they had economically federated the Germanies in the Tariff League (*Zollverein*), preparing the way for political union. After the formation of the German Empire (1871), the influence of the two elements, the landed aristocracy of army officers and the business aristocracy of wealth, was manifested in the demand for a protective tariff. The former demanded a high tariff on imported foodstuffs to raise the price of their own farm-products; the latter required a tariff wall to keep foreign manufactures from entering into competition with German articles in the home market. Bismarck adopted the protective tariff policy in 1879. It is easy to see how such a policy might endanger the peace. For example, consider Russo-German relations. In 1904 Russia and Germany signed a commercial treaty whereby each country made certain reductions in its tariff duties on imports from the other country. The Russians felt that Germany had the best of the bargain. In 1914, as the date approached for the renewal or modification of the treaty, fear was expressed in the German press lest Russia's improved army would enable her to demand more favorable terms. In this fashion the desire of each nation to tax foreign imports and at the same time to obtain free admission of its own products into foreign countries, stimulated militarism and provoked warlike sentiments among the Powers. The United Kingdom, it should be observed, adhered to its free trade policy, and, with few exceptions, admitted the products of all lands on an equal footing. The British self-governing colonies, however, had adopted protection. (3) Whether it was due to the protection of the tariff wall, or to the German genius for applying natural science to industry, or to German thoroughness, or to aggressive commercial methods, the business interests prospered mightily under the ægis of the German Empire. Mills and mines multiplied wealth. Titanic ocean steamships carried German wares to the ends of the earth. By 1912, British ex-

celled German foreign commerce by about \$1,300,000,000; but German commerce had trebled itself since 1883 while British commerce had not quite doubled. The German government derived rich revenues from the customs duties on an expanding commerce, and viewed with satisfaction the prodigious increase in wealth and population (population increased from 41 to 66 millions between 1871 and 1912) which furnished men and money for an ever-growing army. And on the other hand, the industrial and land-owning classes considered the army as protection and insurance for their interests. In one respect, however, the German business community was dissatisfied. The German merchant marine, although it had rapidly expanded, was still four times outweighed by British shipping. Great Britain's superiority was ascribed to her earlier economic development, to the fact that Germany had very little Atlantic sea-coast, to the superiority of the British navy. Germany, therefore, set herself to overcome these handicaps. And without imputing aggressive motives to the German government, the historian may and should affirm that certain German business men consciously hoped for the overthrow of British naval power and for the annexation of an Atlantic port by Germany. The open confession of such desires by German journalists like Maximilian Harden and by German shipping magnates like Herr Ballin, explains why the Belgians fear the loss of Antwerp and Ostend, and the British the loss of the sea. In parenthesis, it may be observed that similar desires for advantageous seaports were urging Russia on to Constantinople and to the Southern Baltic, Servia on to the Adriatic, and Austria-Hungary on to Salonika. (3) In a third respect the economic ambitions of Germany conflicted with those of other nations. In the last quarter of the nineteenth century certain groups of business men awoke to the opportunities which the vast uncivilized areas of Africa and Oceania offered for the sale of cheap cotton goods, cheap liquors, and other manufactures, for the highly remunerative investment of money in the construction of railways, the development of mines, and the traffic in rubber, ivory, and oil. King Leopold of Belgium, one of the first to realize the opportunity, acquired control of the Congo region in the heart of Africa. France carved out a mighty colonial empire, and Great Britain added to hers. Germany, a belated arrival in the field, was permitted, even encouraged, by the British government, to acquire territories in Africa. But when Germany, becoming aggressive in world politics, and demanding an ever larger "place in the sun," challenged the French in Morocco and appeared envious of the British and French possessions, the prospect of a war for world-empire began to fill Europe with uneasy forebodings. (4) Concessions as well as colonies were contended for by German as against British and French capitalists. For example, when in 1914 Bulgaria arranged in return for a loan to concede to German capitalists valuable railway and mining privileges in Bulgaria, a rival bid was unsuccessfully made by the French. (See BULGARIA.) The financing of the Bagdad railway occasioned considerable rivalry between France and Germany, until an agreement was recently reached. In 1914 the envious cry was raised in Germany that German interests were being outstripped by the other Powers; that the

English were greedily helping themselves to the oil product of Persia and striving to secure the oil fields of Latin America; that the French capitalists were securing new railway contracts in China, in Russia, in Greece. (5) Of all the economic interests inimical to peace, the most dangerous was the arms-manufacturing business. It is commonly known that in 1913 Karl Liebknecht horrified the German Reichstag by alleging that the Krupps, the world-famous makers of guns and armor, systematically stirred up hostility between France and Germany in order to obtain larger orders for arms. Every Army Bill, every dreadnought, every war, meant profits for the armament firms. The Balkan Wars were fought with weapons forged in Germany and France. As the Krupps had made the Turkish guns, the defeat of Turkey meant diminished prestige and smaller sales for Krupp wares, unless another war should reestablish the fame of cannon "made in Germany." English firms—Armstrong & Vickers, and Witworth—were engaged to build an ordnance factory in Russia, and to construct battleships for Spain, for Brazil, for Turkey. For Krupps, as well as for their rivals, the War of the Nations was a golden opportunity. The Belgian armament manufacturers at Liège alone were unfortunate, for Liège was captured by German troops. (6) Finally, a word may be added regarding the banking interests and the war. Articles have appeared in support of the argument that the panic and consternation in financial circles at the outbreak of the war proved conclusively that "capital" did not want the war. While there is doubtless much truth in this reasoning, the fact must not be overlooked that in panics large fortunes are won as well as small fortunes lost. The huge war loans, moreover, offered unexampled opportunities for financial speculation. The statement is also made that the capitalists welcomed the war as a relief from the intolerable burden of militarism; for by means of income, property, and inheritance taxes, Socialistically-inclined legislators were shifting the burden of militarism so as to bear more and more heavily on the wealthier classes.

The causes of the War of the Nations may, then, be briefly stated as follows: (1) the development of national sentiment, which threatened to disrupt the Austro-Hungarian Empire, and of national militarism, which bred fear and hatred among the nations; (2) the brusqueness of Austro-German diplomacy, which snapped the strained relations between the Alliance and the Entente; (3) the influence of powerful economic interests which either led to international quarrels or stood to profit by the war.

III. THE OUTBREAK OF THE WAR

THE SARAJEVO ASSASSINATION. The event that precipitated the War of the Nations was the assassination, June 28, of the Archduke Francis Ferdinand, nephew of Emperor Francis Joseph, and heir to the Hapsburg throne, together with his morganatic wife, the Duchess of Hohenburg, while on the Archduke's first official visit to Sarajevo, the capital of Bosnia. Their entry into the town had been interrupted by the explosion of a bomb, thrown by a certain Cabrinovic, and, fortunately enough, warded off by the Archduke with his arm. The bomb

exploded under the following automobile, wounding the Archduke's aide-de-camp, Colonel Merizzi. With admirable coolness the Archduke stopped his car and gave orders to have the colonel and other injured persons attended to; then he proceeded to the town hall, where he was welcomed by the Mayor. Afterwards the Archduke set out to inquire after the condition of the wounded colonel. As the royal car rounded the corner of Rudolph street, a Bosnian youth by the name of Gavrilo Princip fired several revolver-shots from the sidewalk, wounding the Duchess in the side and the Archduke in the neck. Both lost consciousness almost immediately and died before medical assistance could be secured. Princip and Cabrinovic were arrested and held for trial. The bodies of the unfortunate couple were conveyed to Vienna, where they lay in state in the chapel of the imperial palace on the morning of July 3 and were viewed by thousands. After Requiem Masses had been sung and funeral rites observed in the chapel, the corpses were ferried across the Danube to Arstetten on a boat lighted by torches, and were there interred. Requiem Masses were said in London and in other foreign cities for the repose of the souls of the Archduke and his wife. As the children of the murdered Archduke had been excluded from the succession by their father's oath, the new heir to the Austrian throne was the Archduke Charles Francis Joseph, eldest son of Francis Ferdinand's younger brother Otto. The news that Francis Ferdinand had fallen a victim to a Serb assassin caused a tremendous outburst of indignation, manifested by popular anti-Serb demonstrations throughout the empire. For on Francis Ferdinand many hopes had been pinned. His piety had made him a favorite with the Roman Catholics; his vigorous patriotism and his conscientious fulfillment of administrative duties promised well for the future greatness of the Dual Monarchy. Most significant of all, he was a conspicuous friend of the Slavs. He was known to favor the reorganization of the empire so as to place the Slavs on an equal footing with the Germans and the Magyars. For the very reason that he aspired to conciliate the discontented racial elements in Austria-Hungary, and thus to consolidate the Hapsburg monarchy, Francis Ferdinand was more dangerous to the Pan-Serbian cause.

PAN-SERBIANISM AND AUSTRIA-HUNGARY. What caused the fiercest indignation in Austria-Hungary was the wide-spread belief that the Sarajevo crime was a part of the Pan-Serb agitation for the incorporation of Bosnia-Herzegovina in a Greater Serbia. Bosnia and Herzegovina, taken together, form a triangular block of territory, less than half the size of New York State, wedged in between Serbia and Montenegro on the east and Dalmatia and Croatia (both Austro-Hungarian territories) on the west. Once the two provinces had formed part of a great Serb empire under Stefan Dushan, but for centuries since, had suffered oppression under Turkish rule until in 1878 they were occupied by Austria-Hungary, with the consent of the Powers. Having subdued the Beks, or Mohammedan nobility, and having expended about a quarter of a billion dollars for railways, roads, public works, and schools in Bosnia and Herzegovina, Austria-Hungary felt justified in annexing the two provinces in 1908. But the Pan-Serbian agitators claimed Bosnia for Serbia, be-

cause the provinces had formed part of the Serbian Empire for a brief period in the fourteenth century, and because the inhabitants were supposed to belong to the same race and speak the same language as the Servians. Serbia, therefore, protested violently against Austria-Hungary's action in 1908, and was only with much difficulty constrained to promise good neighborly behavior (1909). In spite of its promise, the Serbian government tolerated, if it did not actually foster, the development of Pan-Serbian conspiracies, whose anti-Austrian machinations were exposed at length in a *dossier* published by the Austro-Hungarian government on July 27, 1914. The *dossier* accused the *Narodna Obrana* and affiliated Serb societies of agitating for the detachment of Bosnia-Herzegovina from Austria-Hungary, instigating anti-Austrian crimes, and instructing komitadjis in shooting, bomb-throwing, mine-laying, and bridge-destroying. By terrorism and by insidious propaganda the *Narodna Obrana* aimed to gain Bosnia-Herzegovina for Greater Serbia. The Austrians, however, denied the justice of the Serb claim to the provinces. Only 43 per cent of the 1,800,000 inhabitants of Bosnia-Herzegovina were Orthodox Serbs; the remainder were either Mohammedans, who hated Serbia, or Roman Catholic Croats, whose language, being written in Latin characters, was unintelligible to the Orthodox Serb of Serbia. Probably a majority of the inhabitants would have objected to inclusion in Serbia. In Vienna, Serbia was regarded as an anarchic little State, puffed up by its recent victory in the Balkan War, crazed with a passion for expansion, and dominated by a clique of assassins (the conspirators who brutally murdered King Alexander I, Queen Draga, and two score others in 1903). Serbia had but recently angered Austria-Hungary by refusing to allow the internationalization of the Orient Railway, many shares of which Austria-Hungary had purchased. Serbia stood in the way of Austria-Hungary's commercial communication with Salonika. The Pan-Serbians, moreover, might ultimately realize the "Great Serbian Idea" of uniting in a single empire Serbia, Bosnia-Herzegovina, and Montenegro; in that case Austria-Hungary would have on her southern frontier a strong nation, bitterly hostile to the Hapsburgs, blocking Austrian policies in the Balkans, and acting in sympathy with Russian Pan-Slav aspirations. Such a State would not only be a formidable barrier to prevent Austria-Hungary from advancing further on her "civilizing mission among the Southern Slavs"; it would be a positive danger to the Dual Monarchy. For Pan-Serbianism, which was nothing more than nationalism run riot, if allowed to triumph, would mean the break-up of the Austro-Hungarian State. First Bosnia and Herzegovina would be torn away by Serbia; then Transylvania and other regions by Rumania; soon the Croats would be claimed as kinsmen of the Serbs; the Ruthenes would be added to Russia; and perhaps in the end a Pan-Slav confederacy would wrest all the Slavic races from the Hapsburg Crown. Pan-Serbianism was therefore regarded, and with some justice, as a direct menace to the integrity of the Austro-Hungarian Empire.

THE ULTIMATUM TO SERBIA. The Sarajevo assassination was not the first deed of blood for which Austria-Hungary blamed Serbia, but the high rank of the victims and the clear evidence

that the plot had been hatched in Belgrade, gave the Vienna government reason to believe that the time had come to stamp out Pan-Serbianism once for all. Judicial investigations at Sarajevo, and the confessions of the culprits, led to the startling conclusions that the plot against Francis Ferdinand had been concerted at Belgrade by Gavril Princip, Nedeljko Cabrinovic, and Trifko Grabez,—all citizens of Bosnia-Herzegovina, with the assistance of the Serbian State employee, Milan Ciganovic, and the Serbian Major Voija Tankosic; that the six bombs and the four Browning pistols for the assassination were delivered to Princip, Cabrinovic, and Grabez, by Milan Ciganovic and Major Tankosic at Belgrade; that the bombs came from the arms depot of the Serbian army at Kragujevac; that Ciganovic instructed the conspirators in the use of the bombs and the pistols; that the arms were smuggled across the Bosnian frontier by a secret system of transport under Ciganovic's direction and with the connivance of Serbian frontier officials and customs officers. On the basis of this incriminating evidence, the Austro-Hungarian government at 6 P. M. on July 23* presented an ultimatum to Serbia. This extraordinary document, which has already become historic, was couched in the most peremptory terms; its spirit was that of an outraged government, exasperated beyond endurance, and determined once for all to stop Pan-Serb plotting, regardless of international law or of constitutional formalities. By failing to suppress the anti-Austrian conspiracies, Serbia had violated her promise of 1909 to "live on good neighborly terms" with Austria-Hungary, the ultimatum declared; the crimes culminating in the Sarajevo tragedy had compelled the Austro-Hungarian government at last to abandon its attitude of benevolent and patient forbearance, to put an end "to the intrigues which form a perpetual menace to the tranquillity of the monarchy," and to demand effective guarantees from the Serbian government. The Serbian government must publish on the front page of its Official Gazette and in the Official Bulletin of the army a declaration condemning the propaganda against Austria-Hungary, regretting the participation of Serbian officers and functionaries in that propaganda, and warning the population that henceforward such machinations would be vigilantly anticipated, vigorously suppressed, and rigorously punished. The Serbian government was furthermore called upon (1) to suppress anti-Austrian publications; (2) to dissolve the anti-Austrian society, *Narodna Obrana*, and similar organizations, to confiscate their means of propaganda, and to prevent their reorganization under new names; (3) to eliminate anti-Austrian propagandists, and to discard anti-Austrian text-books from the Serbian educational system; (4) to discharge such officers and officials as the Austro-Hungarian government should accuse of anti-Austrian propaganda; (5) "to accept the collaboration in Serbia of representatives of the Austro-Hungarian government in the suppression of the subversive movement directed against the territorial integrity of the monarchy"; (6) "to take judicial proceedings against the accessories to the plot of June 28

who are on Serbian territory," and to allow delegates of the Austro-Hungarian government to take part in the investigation leading thereto; (7) to arrest Major Tankosic and Milan Ciganovic, "who have been compromised by the results of the magisterial inquiry at Sarajevo"; (8) to prevent by effective measures the coöperation of Serbian authorities in the illicit traffic in arms and explosives across the frontier, and to punish the officials who had assisted the perpetrators of the Sarajevo crime by facilitating their passage across the frontier; (9) "to furnish the Imperial and Royal government with explanations regarding the unjustifiable utterances of high Serbian officials, both in Serbia and abroad, who, notwithstanding their official position, have not hesitated since the crime of the 28th June to express themselves in interviews in terms of hostility to the Austro-Hungarian government"; (10) to signify acceptance of the Austro-Hungarian demands within 48 hours.

The Austro-Hungarian Note, communicated to the Powers on the following day (July 24), was pronounced by English, French, and Russian diplomats a most formidable document, to which Serbia could hardly yield without an humiliating surrender of her sovereign rights as an independent State. The Political Director at once advised Serbia to invite arbitration and to act with all caution; Sir Edward Grey urged compliance with as many points as possible; but complete acceptance by Serbia of the Austro-Hungarian demands seemed to be out of the question. Whether an unsatisfactory answer would cause Austria-Hungary to declare war immediately, was not quite clear. In case Austria-Hungary should actually attack Serbia, Russia would certainly come to Serbia's aid with diplomatic and perhaps with military measures; for Russia felt a strong interest in preventing Austria-Hungary from destroying the independence of Serbia. By strong ties of racial kinship and religion, Russia was bound to protect Serbia. The German government, however, strongly maintained that no European Power had the right to interfere in Austria-Hungary's affair with Serbia. The German ambassador in Paris declared that "The German government desire urgently the localization of the dispute, because every interference of another Power would, owing to the natural play of alliances, be followed by incalculable consequences." It was practically a threat that if Russia intervened, Germany would once again stand at the side of her ally "in shining armor," and a general European war would result. As Russia was embarrassed by a serious and violent strike (see RUSSIA), France by the bitter Caillaux controversy (see FRANCE), and Great Britain by the menace of an Irish civil war (see GREAT BRITAIN), and as the French President and Premier were at sea, returning from a visit to Russia, the Triple Entente would be at a serious disadvantage in offering either diplomatic or armed resistance to Germany and Austria-Hungary. The Powers of the Triple Entente urged, above all things, that Austria-Hungary should extend her time-limit, so as to allow negotiations for a possible peaceful settlement, and afford opportunity for Austria-Hungary to revise or justify her ultimatum. On July 24 the Russian minister for foreign affairs, M. Sazonov, instructed the Russian representative at Vienna to demand a prolongation of the term of the ultimatum; Great

* Owing to a difference of thirteen days between the calendar used in Orthodox countries and the calendar used in Western Europe, the Austro-Hungarian note of July 23 was received in Serbia on July 10. In this article, to avoid confusion, all dates are translated into Western time.

Britain and France decided to support the demand; Germany, however, refused to support the demand for delay, and when urged by Great Britain and Russia, the German minister, Herr von Jagow, replied that he had doubts as to the wisdom of Austria yielding at the last moment, and was inclined to think that such a step might increase the assurance of Serbia. Herr von Jagow feared that the plea would have no result. The Russian chargé d'affaires at Vienna found it impossible to see the Austro-Hungarian foreign minister, Count Berchtold, in regard to the proposed time-extension, as the latter had left for Ischl (a watering place about 140 miles west of Vienna) just at this most critical moment; the proposal was communicated by wire, however, and was flatly rejected by the Austro-Hungarian government. Thus the first diplomatic move to prevent war failed.

THE SERBIAN REPLY. The Serbian Reply to the Austro-Hungarian Note was delivered on July 25. The Russian foreign minister, when informed of the tenor of the Serbian Reply, thought it more conciliatory than could have been expected; he could "not see what further demands could be made by Austria, unless the Vienna Cabinet is seeking for a pretext for war with Serbia." The Austro-Hungarian minister, however, considered the Reply unsatisfactory and immediately left Belgrade. The reasons for refusing to accept the Serbian answer were set forth by the Austro-Hungarian government in a running commentary which was published in the newspapers together with the text of the Reply. The Reply declared that "the Royal government cannot be held responsible for utterances of a private character such as newspaper articles and the peaceful work of societies"; the Serbian government denied having made any attempt officially "to change the political and legal conditions set up in Bosnia and Herzegovina." To Austria-Hungary this contention was absolutely inadmissible; Serbia was accused, not of official attacks on the Dual Monarchy, but of failing to suppress movements directed against the territorial integrity of the monarchy in spite of the pledge of March 18, 1909, to cultivate good neighborly relations with Austria-Hungary. In reply to Austria-Hungary's more specific demands, Serbia declared herself ready "to turn over to the court (Austrian), regardless of station or rank, any Serbian subject concerning whose participation in the crime at Sarajevo proofs may be given." The declaration regretting and condemning anti-Austrian propaganda was slightly modified. Most of the other points of the Austro-Hungarian Note were accepted, with slight modifications which were taken by the Austro-Hungarian government as proof of Serbia's insincerity. In regard to three points, however, Serbia refused to comply. In the first place, Serbia refused to suppress anti-Austrian publications until such action could be legalized by the enactment of a new Press Law in the next regular session of the Skupstina and the revision of Article XXII of the Constitution. In the second place the Serbian government could not agree to the coöperation of Austro-Hungarian delegates in the suppression of anti-Austrian movements in Serbia, although such coöperation would be permitted "as might be in conformity with international law and criminal procedure, as well as with friendly neighborly relations." The Austro-Hungarian government observed on this

point, "International law has as little to do with this question as criminal procedure. The question is purely one of national policing, to be solved by special agreement." In the third place, the coöperation of special delegates of the Austro-Hungarian government in the investigation of the Sarajevo plot, was declined by Serbia as "a violation of the laws and criminal procedure." "However, in individual cases," Serbia conceded, "information as to the progress of the investigation might be given the Austro-Hungarian delegates." This reply the Austro-Hungarian government regarded as a deliberate misinterpretation by Serbia of the Austro-Hungarian demand for participation in the preliminary "*recherches*" or police inquiries, not in the "*enquête judiciaire*" or judicial proceedings. In conclusion, the Serbian government declared that "in case the Austro-Hungarian government should not consider itself satisfied with this answer, it (the Serbian government) is ready as always to accept a peaceful solution, either by referring the decision of this question to the international tribunal at The Hague or by leaving it to the great Powers who coöperated in the preparation of the explanation given by the Serbian government on the 18th (31st) March, 1909."

THE DECLARATION OF WAR AGAINST SERBIA. Austria-Hungary did not at once declare war on Serbia; but the partial mobilization of the Austro-Hungarian army, the withdrawal of the Serbian capital to Nish, and the mobilization of the Serbian army, presaged ill for the peace of Europe. As a war between Austria-Hungary and Serbia would almost certainly draw in Russia and other Powers, it became of prime importance to prevent or at least to delay the Austro-Hungarian declaration of war. With this end in view, the Russian minister of foreign affairs, M. Sazonov, interviewed the Austro-Hungarian ambassador in Petrograd, Count Szapary, and asked him to obtain the permission of his government for a private exchange of views in order to redraft certain articles of the Austro-Hungarian Note of the 23rd. Such direct conversations between Vienna and Petrograd might lead to an amicable understanding, and would surely remove the unfortunate impression created by Austria-Hungary's failure to explain her intentions frankly to Russia. While these Russian overtures were awaiting Austrian approval, a parallel effort to preserve the peace was being made by British diplomacy. Sir Edward Grey at first had proposed that Germany, France, and Italy should join with Great Britain in a mediatory attempt, in the first instance to gain an extension of time. When this was frustrated by the curt refusal of the Austro-Hungarian government, Sir Edward Grey proposed that the ambassadors of Germany, Italy, and France should meet in conference at London with the British minister of foreign affairs to discover a basis for peaceful agreement. To this suggestion, France and Italy promptly gave their assent; the German Secretary of State, unfortunately, thought it impossible to arrange such a conference, and preferred to rely on the direct exchange of views between Vienna and Petrograd. At the same time Germany refused to urge her ally to adopt a conciliatory tone in the conversations with Russia and declined to join with the three other Powers in urging Austria-Hungary "to abstain from all action which might aggravate the existing situation." The

German Chancellor insisted that the quarrel with Serbia was a purely Austrian concern with which Russia had no right to meddle. The German ambassador at Paris declared that Germany desired to work for the maintenance of peace, but could not join with the Powers in pressing Austria-Hungary to accept arbitration or a conference. As the German "White Book" (*infra*) put it, "We could not call Austria in her dispute with Serbia before a European tribunal." The uncompromising attitude of Austria-Hungary and Germany was the more dangerous as Russia had openly declared her intention to protect Serbia. On July 27, in reply to a telegram (July 24) from the Prince Regent of Serbia, the Czar urged Serbia to neglect "no step which might lead to a settlement," and promised that if in spite of Russia's pacific endeavors war should break out, "your Highness may rest assured that Russia will in no case disinterest herself in the fate of Serbia." On July 28 the Russian foreign minister frankly stated that the "order for mobilization against Austria would be issued on the day that Austria crossed the Serbian frontier." The German ambassador at Petrograd was advised that, "Russia being thoroughly in earnest, a general war could not be averted if Serbia were attacked by Austria." No less threatening was the temper of the German government. The German ambassador at Petrograd was instructed to inform the Russian government that, "Preparatory military measures by Russia will force us (Germany) to counter-measures which must consist in mobilizing the army. But mobilization means war. As we know the obligations of France towards Russia, this mobilization would be directed against both Russia and France. We cannot assume that Russia desires to unchain such a European war." Apparently official circles in Berlin believed that the Russian government was only "bluffing" and could be easily intimidated by Germany, for both the German Secretary of State and the Austro-Hungarian ambassador at Berlin expressed the opinion that Russia was neither desirous nor prepared for war. Only such a conviction—or else a deliberate intention to provoke a European conflict—could explain the action of the Austro-Hungarian government in declaring war on Serbia at noon on July 28. The declaration of war, said the Austro-Hungarian foreign minister, Count Berchtold, made mediation impossible. "The Austro-Hungarian government, who had only decided, much against their will, on the energetic measures which they had taken against Serbia, could no longer recede, nor enter into any discussion of the terms of the Austro-Hungarian note." Count Berchtold added "that the crisis had become so acute, and that public opinion had been incited to such a pitch, that the government, even if they wished it, could no longer consent to such a course." All this time, be it observed, while repudiating any desire to destroy the territorial integrity of Serbia, Austria-Hungary had neglected to assure Russia that the sovereignty as well as the territory of Serbia would be respected. The Russian government therefore concluded that Austria-Hungary intended to reduce Serbia to a dependent position.

GERMANY AGAINST RUSSIA. On July 29 the Russian government decreed the mobilization against Austria-Hungary of 13 army corps in the four southwestern military districts of Kiev, Ka-

zan, Odessa, and Moscow, since Austria-Hungary had declined direct conversations with Russia, declared war on Serbia, mobilized* the greater part of her army, and—it was claimed—sent troops to the Russian frontier. On the same day, M. Sazonov informed the German ambassador that these measures were defensive and not directed against Germany. Russia was willing to carry on direct conversations with Vienna, or to accept the British proposal for a Four Power Conference, or, better still, to combine both methods. The following day, Herr von Jagow declared the Russian plan unacceptable to Austria-Hungary. France and Russia signified their willingness to accept any kind of diplomatic action which Sir Edward Grey might think most effective for the preservation of peace. Discouraged by Germany's apparent repugnance to any formal conference, Sir Edward Grey on July 29 "urged that the German Government should suggest any method by which the influence of the four Powers could be used together to prevent war between Austria and Russia. France agreed, Italy agreed. The whole idea of mediation or mediating influence was ready to be put into operation by any method that Germany could suggest, if mine was not acceptable. In fact, mediation was ready to come into operation by any method that Germany thought possible if only Germany would 'press the button' in the interests of peace." Although it was somewhat late for such action, the German government urged Austria-Hungary at last to take up Russia's once-refused offer of direct discussion between Vienna and Petrograd. On July 30 Count Berchtold, the Austro-Hungarian foreign minister, held a friendly conversation with M. Schebeko, the Russian ambassador, and promised that the Austro-Hungarian ambassador would discuss with M. Sazonov "what settlement would be compatible with the dignity and prestige for which both empires had equal concern." On the evening of July 31, the Austro-Hungarian ambassador in Petrograd announced that his government was willing to discuss with Russia the basis of the Note to Serbia; at the same time the Austro-Hungarian ambassadors in Paris and London declared that their government had officially notified Russia that, if Russia would stand aside, neither the sovereignty nor the territory of Serbia would be violated (denied by the Russian ambassador in Paris, August 1). In the meantime M. Sazonov had put forward as a basis for peace the following formula: "If Austria, recognizing that the Austro-Serbian question has become a question of European interest, declares herself ready to eliminate from her ultimatum such points as violate the sovereign rights of Serbia, Russia undertakes to stop her military preparations." But Herr von Jagow, the German foreign secretary, pronounced the Russian formula unacceptable, July 30. At the request of Great Britain, Russia made the formula even more conciliatory: "If Austria will agree to check the advance of her troops on Serbian territory; if, recognizing that the dispute between Austria and Serbia has become a question of European interest, she will allow the Great Powers to look into the matter and decide what satisfaction Serbia could afford to the Austro-Hungarian government without impairing her rights as a

* Austria-Hungary had not yet ordered a general mobilization, as the Russian ambassador mistakenly telegraphed his government on July 28.

sovereign State or her independence, Russia will undertake to maintain her waiting attitude." In his eagerness to secure the help of Germany in preventing a war between the Great Powers, Sir Edward Grey went so far as to tell the German ambassador, July 31, that "if Germany could get any reasonable proposal put forward which made it clear that Germany and Austria were striving to preserve European peace," and if Russia and France unreasonably rejected such a proposal, Great Britain "would have nothing to do with the consequences," i.e., would not support France and Russia. Otherwise, if France should be involved as the ally of Russia in a war against Germany and Austria-Hungary, Great Britain would be "drawn in." The best answer that Herr von Jagow, whose government still professed to desire peace, could make, was that he would lay the suggestion before the Kaiser and the Chancellor, but could not discuss it unless Russia agreed to countermand her mobilization at Germany's demand. Germany thus refused Grey's last appeal, and attempted to fix the responsibility on Russia.

It appears then, that by the night of July 31, while Austria-Hungary was ostensibly willing to satisfy Russia by discussing the basis of the Note of July 23 with Russia, relations between Germany and Russia were being strained to the breaking point. On the following day, August 1, Germany was to declare war on Russia, not because a solution of the Serbian question appeared impossible of attainment, but because Russia was mobilizing her army. On July 29, when Russia had ordered mobilization in four districts on the Austro-Hungarian frontier, the Kaiser had telegraphed the warning to the Czar that "military measures by Russia, which might be construed as a menace by Austria-Hungary, would accelerate a calamity which both of us desire to avoid." The Czar had replied, July 30, that the partial Russian mobilization had been decided five days ago (i.e., July 25) and "for reason of defense against the preparations of Austria." M. Sazonov stated, moreover, on July 30, that he had absolute proof that Germany was making military and naval preparations against Russia. On July 30, also, Jules Cambon reported the German foreign minister Von Jagow as saying that the heads of the army in Germany were insisting on German mobilization since every delay would be a loss of strength to the German army. That same day, according to French and Russian documents, a special edition of the *Lokal Anzeiger* was "accidentally issued in Berlin prematurely announcing German mobilization." The Russian government, already angered by the news that Austria-Hungary had bombarded Belgrade on July 30 and moved troops toward the Russian frontier, was still further provoked by the Austro-Hungarian proclamation of general mobilization, issued at 1 A. M., July 31, and followed suit with a decree for Russian general mobilization, July 31, in the afternoon. The same afternoon, telegrams were exchanged by the Kaiser and Czar, the former advising that "the peace of Europe can still be preserved by You if Russia decides to discontinue those military preparations which menace Germany and Austria-Hungary," the latter declaring it "technically impossible" to discontinue the mobilization necessitated by Austrian mobilization, and promising as long as negotiations continued to "undertake no provocative action."

Nevertheless, at midnight on July 31, the German ambassador delivered a twelve-hour ultimatum demanding that Russia stop the process of mobilization not only against Germany, but against Austria-Hungary as well. To this peremptory summons, Russia vouchsafed no reply. Demobilization would have left Russia defenseless before the mobilized armies of Austria-Hungary and open to a swift attack from Germany. Two hours after the expiration of the time-limit, the Czar telegraphed asking the Kaiser to promise, as Russia had promised, that in spite of mobilization Germany would strive for peace. The Kaiser replied that war could be averted only by Russian compliance with the German ultimatum. German mobilization was ordered on August 1 at 5 P. M. At 7:10 P. M. the German ambassador at Petrograd presented a note declaring that since Russia had refused to demobilize, a state of war now existed between Russia and Germany.

GERMANY AGAINST FRANCE. At 7 P. M. on July 31, five hours before the German ultimatum was delivered at Petrograd, another German ultimatum was presented in France, demanding within 18 hours a declaration whether France would remain neutral in a Russo-German conflict. As France was allied with Russia, the French Premier gave a noncommittal reply at 1 P. M., August 1, and four hours later ordered the mobilization of the French army. Germany did not declare war on France, however, until 6:45 P. M., August 3. In declaring war on Russia Germany alleged that Russia had begun the conflict by moving troops into German territory on the afternoon of August 1. Similarly, in declaring war on France, the German government alleged that several French military aviators had "openly violated the neutrality of Belgium by flying over the territory of that country," that another French military aviator had attempted to destroy buildings near Wesel, another thrown bombs on the railway near Karlsruhe and Nuremberg, and others had been seen in the district of Eifel. These "wretched inventions" were strenuously denied by M. Viviani. On the other hand, the French government declared that German troops had crossed the French frontier at three different points on August 2, and that at the French village of Joncherey, ten kilometers within the frontier, a German officer, leading a patrol of mounted Jaegers, had blown out the brains of a French soldier.

INVASION OF LUXEMBURG AND BELGIUM. Two small "buffer States"—Belgium and Luxemburg—lay in the path of the German armies that were to invade France. Although France, honoring the treaty of London, 1867, had on August 1 promised to respect the neutrality of the Grand Duchy of Luxemburg, Germany sent troops early on Sunday morning, August 2, to invade Luxemburg, in order, said the German Chancellor, to assure the use of the railways which had been leased to Germany. Luxemburg protested in vain against this violation of her neutrality, and against the further arbitrary action of the German military authorities in ordering the expulsion, August 4, of the French minister accredited to Luxemburg. Indemnities were subsequently paid by Germany to Luxemburg, amounting, by the close of November, to \$256,000. The invasion of Belgium was heralded by the presentation of a German ultimatum to the Belgian government at 7 P. M. on August 2. The German

government asserted that it had "reliable information regarding the contemplated march of French forces on the line of the Meuse by Givet and Namur,"—information which left "no doubt as to the intention of France to proceed through Belgian territory against Germany." In self-defense, Germany felt bound to anticipate any such hostile action by sending German forces to repel the French invasion. If Belgium would maintain an attitude of "benevolent neutrality" and allow the passage of German troops (thus expressly violating the Hague Convention V, which Germany and the other Powers had signed in 1907), the possessions and independence of Belgium would be guaranteed and an indemnity paid by Germany; but if Belgium should in any way resist, Germany would treat her as an enemy, and "the decision of arms" would determine the future relations of Belgium to Germany. Twelve hours were allowed for the Belgian reply. At 7 A.M., August 3, the Belgian foreign minister handed a note to the German minister at Brussels, pointing out that France on August 1 had formally pledged herself to respect Belgian neutrality, and that the proposed German action would be a flagrant violation of international law. Belgium therefore proposed to prevent by every means in her power any violation of her neutrality. King Albert immediately appealed to the "diplomatic intervention" of Great Britain to safeguard the neutrality of Belgium. When this failed, and German forces entered Belgian territory at Gemmenich on the morning of August 4, Belgium appealed to Great Britain, France, and Russia to assist in opposing the German invasion by force of arms. On August 10 the Belgian government received a second German communication, forwarded through the Netherlands, regretting that "bloody encounters should have resulted from the Belgian government's attitude towards Germany," and urging the Belgian government to "spare Belgium the further horrors of war" by forming a compact with Germany. The invitation was indignantly declined.

GREAT BRITAIN AGAINST GERMANY. The violation of Belgian neutrality was the official reason for Great Britain's entry into the war against Germany. From the first days of the crisis, Sir Edward Grey, the British foreign minister, had taken a leading part in promoting projects for the peaceful settlement of the dispute between Serbia and Austria-Hungary by the mediation of Great Britain, Germany, France, and Italy. M. Sazonov and M. Poincaré urgently advised him that the best way to prevent war would be to inform the German government that they would have to deal with Great Britain as well as with Russia and France if they supported Austria-Hungary by force of arms; but Sir Edward Grey refused to commit himself. On the other hand, he took great pains on July 29 to warn the German ambassador that in case of a general European war Great Britain might suddenly decide to intervene, and that the friendly tenor of British diplomacy must not mislead Germany into believing that Great Britain would in any case stand aside. That night the German Chancellor, hoping to induce Great Britain to remain neutral, offered to promise that Germany would annex no French territory, and no Belgian territory—unless Belgium sided against Germany; but with regard to the French colonies Herr von Bethmann-Hollweg could make

no promises. In rejecting this suggested bargain, July 30, Sir Edward Grey reserved for Great Britain "full freedom to act as circumstances may seem to us to require." In readiness for any emergency, the British First Fleet was held concentrated at Portland. On July 31 Sir Edward Grey warned the German ambassador that Great Britain might be drawn in if France were involved. The same day, in view of the threatened German mobilization, he asked whether France and Germany intended to respect Belgian neutrality in event of war. France replied in the affirmative, July 31, but Germany was "not in a position to reply." Sir Edward Grey thereupon warned Germany that the violation of Belgian neutrality would probably excite public opinion in Great Britain to such an extent that Great Britain would intervene. He would not, however, promise to remain neutral even if Germany should agree to respect Belgian neutrality, or if Germany should promise to leave the territory and colonies of France intact. On the following day, August 3, Sir Edward Grey made a lengthy speech in the Commons, explaining that while Great Britain was under no treaty obligations to assist France, he had assured the French ambassador on August 2 that the British fleet would prevent the German fleet from attacking French coasts or shipping. He went on to explain that as a guarantor of Belgian neutrality and independence Great Britain was vitally concerned in preventing the conquest of Belgium by Germany. The following day, August 4, when news was received that Germany had violated Belgian territory at Gemmenich, Sir Edward Grey dispatched an ultimatum to Germany, requiring an answer by midnight, that Germany would respect the neutrality of Belgium. Germany refused, on the ground of military necessity. With evidence of anger and disappointment, the German Chancellor rebuked Great Britain for making war just for "a scrap of paper." An excited mob threw stones through the window of the British Embassy in Berlin. The next day, Mr. Asquith announced that a state of war had existed between Germany and Great Britain since 11 P.M., August 4.

DECLARATIONS OF WAR. For convenient reference the various declarations of war are here listed: Austria-Hungary against Serbia, July 28; Germany against Russia, August 1, 7:10 P.M.; Germany against France, August 3, 6:45 P.M.; German invasion of Belgium, the morning of August 4; Great Britain on Germany, August 4, 11 P.M.; Austria-Hungary on Russia, August 6; Montenegro on Austria-Hungary, August 8; Serbia on Germany, August 9; France on Austria-Hungary, August 10; Great Britain on Austria-Hungary, August 12; Montenegro on Germany, August 12; Japan on Germany, August 23; Austria-Hungary on Japan, August 25; Austria-Hungary on Belgium, August 28; Turkish hostilities against Russia, October 29; Russian, French, and British ambassadors to Turkey ask for passports, October 30.

THE "WHITE PAPER" AND THE BRITISH CASE. Soon after the outbreak of war, the British government issued a collection of diplomatic documents and dispatches in a "White Paper" entitled *Miscellaneous No. 6: Correspondence Respecting the European Crisis*. The "British White Paper," as it was commonly called, served as a storehouse of materials for controversialists who quoted diplomatic notes to prove that the

British cause was just. Germany, France, Russia, and Belgium issued similar compilations. It is largely from these sources that the foregoing account has been compiled. These official publications, and the grounds upon which each nation attempted to justify its participation in the war, can be only briefly discussed here. Great Britain went to war with Germany for three reasons, according to Mr. Asquith, the prime minister.—“In the first place, to vindicate the sanctity of treaty obligations and of what is properly called the public law of Europe; in the second place, to assert and to enforce the independence of free States, relatively small and weak, against encroachment and violence by the strong; and in the third place, to withstand, as we believe in the best interests not only of our own Empire, but of civilization at large, the arrogant claim of a single Power to dominate the development of the destinies of Europe” (Edinburgh Speech, September 18). To these reasons are sometimes added the desire to defend democratic government against autocracy, to stamp out German militarism, and to maintain British naval supremacy. The adverse criticism of Great Britain may be summarized under four heads. (1) In the first place, it is argued, Sir Edward Grey by frankly threatening war at the outset might have induced Germany and Austria-Hungary to accept mediation. But he had neither the authority, nor the certainty of success, to warrant such action. (2) Secondly, Dr. Bernhard Dernburg, in a review of the White Paper, alleges that the protection of Belgium was only a shallow pretext cleverly assigned by Sir Edward Grey as an excuse for attacking Germany. Grey had refused to remain neutral even if Germany would promise not to violate Belgian territory; he had made a naval agreement with France virtually committing Great Britain to war, without any reference to the Belgian question. Furthermore, the Germans argued, Great Britain's concern for “small nations,” “treaty obligations,” and “neutrality,” was insincere: Great Britain had shown no concern for the fate of Serbia; she had ruthlessly destroyed the Boer Republic in South Africa; more than once she had violated treaties; and she had shown her disregard for the rights of neutrals by sending British troops through Portuguese colonial territory in the Boer War, and by permitting her ally, Japan, to land troops on the neutral territory of protesting China. (3) Thirdly, the Germans most bitterly accuse Great Britain of welcoming, and even instigating, the war which would enable her to crush German commercial and industrial competition. (4) Finally, when rebuked for their own militarism, the Germans retaliate by taxing Great Britain with “navalism.”

THE GERMAN “WHITE BOOK.” In order to prove that Germany had been foully attacked by Russia, the German government published a “White Book” giving the German version of the outbreak of the war but not even pretending to contain the complete diplomatic correspondence. With amazing frankness the German government in its White Book admits that in order to preserve the power and prestige of her ally, Germany “permitted Austria a completely free hand in her action towards Serbia.” With equal candor, the German government confesses that it refused mediation in the Austro-Servian conflict, as that would have constituted “an infraction of

(Austria-Hungary's) sovereignty.” After reading the British documents it is somewhat disconcerting to learn that Germany “labored incessantly” for peace, “shoulder to shoulder with England,” by supporting pacific proposals in Vienna. Telegrams between the Czar and the Kaiser, and reports of Russian military preparations, are inserted in the White Book to prove that Russia's mobilization caused the war. Without offering the slightest substantiation of its statement, without even specifying the locality, the German White Book asserts that in the afternoon of August 1 “Russian troops crossed our frontier and marched into German territory. Thus Russia began the war on us.” Nor is any proof offered that “On the morning of the next day France opened hostilities.”

A second German White Book, *How the Franco-German Conflict Could Have Been Avoided*, reproduces telegrams sent to and from King George, July 30-August 1. The first four telegrams are interesting chiefly because the three greatest monarchs of Europe appear as “Willy,” “Georgie,” and “Nicky.” The fifth and following dispatches show that Germany would have been ready to delay her invasion of France until the night of August 3, on condition that Great Britain would guarantee, by force if necessary, the absolute neutrality of France. Great Britain refused. The Kaiser's telegram of August 1 is especially interesting as it shows that “on technical grounds” German mobilization, once proclaimed, could not be suddenly countermanded, but had to be completed; yet it was because Russia refused to countermand her partially-completed mobilization that Germany declared war on Russia.

THE RUSSIAN “ORANGE BOOK.” The “Orange Book” published by the Russian government contains 79 diplomatic documents, harmonizing in general with the “British White Paper.” No. 47, however, dated July 28, and briefly announcing that “the order for general mobilization (in Austria-Hungary) has been signed,” is hardly consistent with the note published in the French “Yellow Book” (No. 115) declaring that general mobilization was proclaimed by Austria-Hungary at 1 A. M., July 31. It is also significant that the “Orange Book” contains no communication addressed to Belgrade from Petrograd before July 27, when the Czar replied to the Prince Regent's telegram of July 24. Hence it may be inferred that Russia refrained from advising Serbia how to answer the ultimatum of July 23, or else that the “Orange Book” is incomplete. In the allegation that news of German mobilization was “accidentally” published on July 30 two days too soon, the “Orange Book” is confirmed by the French “Yellow Book.”

THE FRENCH “YELLOW BOOK.” In many respects the most notable collection of documents was issued by the French government. In addition to an impressive array of documents showing how the pacific efforts of the Allies were frustrated by Germany's abrupt ultimatums, the French “Yellow Book” contains reports analyzing the warlike spirit in Germany in 1913. An “official secret report” received from “a reliable source” by M. Etienne in 1913, purports to present the conviction of some high German official that the German people must be prepared to look on an offensive war as a necessity. “We must so manage matters,” says the official, “that under the heavy weight of powerful armaments,

considerable sacrifices, and strained political relations, an outbreak should be considered as a relief." In No. 3, dated "Berlin, May 6, 1913," the French ambassador represents General von Moltke as saying that "Germany cannot and ought not to leave Russia time to mobilize. . . . We must anticipate our principal adversary as soon as there are nine chances to one of going to war, and begin it without delay in order ruthlessly to crush all resistance." Equally interesting is the report prepared for M. Pichon on public opinion in Germany according to reports of diplomatic and consular agents. The Conservative country squire, says the writer of No. 5, would welcome war as an escape from death duties and from Socialism; the higher bourgeoisie, represented by the National Liberal Party, "the party of contented spirits," hates France as the home of revolutionary ideas; "the manufacturers of guns and armor plate, the big merchants who demand bigger markets, bankers who are speculating on the coming of the golden age and the next war indemnity—all these regard war as good business"; officials of all kinds are inspired by "Bismarckian" arrogance; professors of economics demonstrate by statistics Germany's need for a colonial and commercial empire commensurate with her industrial output; historians, philosophers, and pamphleteers glorify German "Kultur"; disappointed diplomats regard France with rancor; and the forces making for peace are weak and unorganized. Another interesting document is the report of the French ambassador at Vienna, July 15, 1914, quoting the *Militärische Rundschau* to the effect that since war with Russia would surely come in the next few years, it should be provoked at once, while circumstances favored Austria-Hungary and Germany. No. 75 is a long memorandum prepared by the Austro-Hungarian government, setting forth in full detail the malignant machinations of Pan-Serbianism. No. 115, if authentic, proves that general mobilization was ordered by Austria-Hungary before it was decreed by Russia. Documents 106 and 136, re-enforced by the Premier's speech (No. 159), would tend to show that German military preparations against France were well under way before mobilization was officially declared, that in order to prevent unpleasant "incidents, the French troops were forbidden to approach within 10 kilometers of the frontier," and that German troops committed more serious hostile acts on French territory than those alleged by Germany as cause for declaring war against France. No. 155 is an account of the insults and indignities suffered by M. Jules Cambon, the French ambassador at Berlin, in returning to France after the declaration of war.

THE CASE OF BELGIUM. The impression prevailing in the United States that Belgium had been unjustifiably and ruthlessly attacked by Germany was confirmed by the Belgian government's "Gray Paper" containing the diplomatic correspondence from July 24 to August 29. A Belgian Commission to the United States published a pamphlet entitled *The Case of Belgium*, in which Germany was reproached with invading and covering "with blood and ruin a small, peaceful country, of hardworking and honest people, a country which it had promised to protect." By the treaty of 1839 the King of Prussia had joined with the governments of Great Britain, France, Austria-Hungary, Russia, and

Holland, in guaranteeing that Belgium should form "an independent and perpetually neutral State." The Hague Convention of 1907 on the Rights and Duties of Neutral Powers had clearly stated that: "The territory of neutral powers is inviolable. . . . Belligerents are forbidden to allow troops or trains of ammunition or provisions to pass through the territory of the neutral power. . . . It shall not be considered a hostile power if it takes measures, even forcible, to prevent violations of its neutrality." Germany was pledged to this Hague Convention as well as to the treaty of 1839. By attacking Belgium, Germany violated both pledges. The German Chancellor himself confessed the wrong in his speech before the Reichstag on August 4,—"We are now in a state of necessity, and necessity knows no law. Our troops have occupied Luxemburg and perhaps are already on Belgian soil. [They were.] Gentlemen, that is contrary to the dictates of international law. . . . We knew, however, that France stood ready for invasion. France could wait but we could not. . . . So we were compelled to override the just protest of the Luxemburg and Belgian governments. The *wrong*—I speak frankly—that we are committing we will endeavor to make good as soon as our military goal has been reached." Again, in an excited conversation with the British ambassador, Herr von Bethmann-Hollweg referred to the treaty of 1839 as "a scrap of paper." The phrase has already become classic as an indication of Germany's willingness to sacrifice treaty obligations to military expediency. Discovering that shameless treaty-breaking was condemned by an overwhelming public opinion, the German and German-American apologists dropped the plea of "military necessity" for the invasion of Belgium, and asserted that Belgian neutrality had not been violated by Germany, but rather by the alleged flight of French military aviators over Belgium, the alleged presence of French officers and British stores in Belgium, and other incidents. These accusations, however, were not supported by well-attested proof, nor were they the cause for Germany's attack. Germany made war on Belgium because Belgium refused to allow German troops to march through her territory. Yet another apology was advanced by the Imperial Chancellor in his Reichstag speech of December 2, and by Dr. Bernard Dernburg in the pamphlet *The Case of Belgium*. On the basis of documents which the Germans claimed they discovered in the office of the Belgian General Staff at Brussels, Belgium was accused of "surrendering her neutrality to England." The documents, if genuine, proved nothing more, however, than that Belgian military authorities had discussed with British military attachés, in 1906 and in 1912, what joint military action should be taken in the hypothetical case that Germany, proving unfaithful to her treaty obligations, should violate Belgian neutrality. There was no agreement that British troops should land in Belgium before Germany had invaded Belgium. It is therefore difficult for a neutral mind to understand in what respect such conversations could constitute an infraction of Belgian neutrality.

IV. MILITARY OPERATIONS

GENERAL STRATEGY AND RESOURCES. The War of the Nations originated as a struggle on

INFANTRY

TYPICAL INFANTRYMEN OF EUROPEAN ARMIES

the part of Austria-Hungary and Germany against the "Slavic Peril"—against the huge Slav empire of Russia and the small Slav kingdoms of Serbia and Montenegro. But from the very beginning of the conflict, defense against Russia was of minor interest as compared with the attack on Belgium, Britain, and France. The reason was quite simple. The German General Staff* had planned, so said the military experts, that the bulk of the German army should be hurled first against France, and then, having crushed France, be transferred to the east to turn back the tide of Russia's slow-mobilizing multitudes. For Russia, with all her 171 millions of inhabitants in Europe and in Asia, was spread over so vast an area and was so deficient in railways that 10 of her 36 army corps (an army corps may be counted as 50,000 men) could not be expected to arrive on the scene in the first month, and the remaining 26 could not begin a serious attack within the first few weeks of the war. Germany could leave 5 of her 25 army corps to cooperate with 12 Austrian corps in holding back the Russian advance guard, while 2 Austrian corps "punished" Serbia, and the remaining 2 Austrian and 19 German corps crushed France. The German armies in the west would sweep across Belgium—with its network of convenient railways and smooth highways—turning the flank of the strong line of French fortifications along the Franco-German frontier, and swoop down upon Paris with irresistible might. The French army annihilated, the German troops could be shifted from the west to the east (it is only a little more than 500 miles from Belgium to Russia, that is, twice the distance from Albany to Buffalo) and reserves could be brought up to defeat the advancing Russians. The attack on France and Belgium, however, met with such fierce resistance that although 13 reserve corps were sent into France on the heels of 21 active corps, in August, followed by 4 substitute reserve corps at the end of August, 8 Landwehr corps in September, and 5 semi-corps of reserves in October, in addition to 10 cavalry divisions, the German forces in France and Belgium had to fall back after their first swift stroke and could then do little more than hold a long intrenched battle line against the enemy. This delay in the west gave the dreaded "Russian hordes" time to mass in Poland for an invasion of Austria-Hungary and Germany. The Austro-Hungarian armies, moreover, began to show alarming weakness, and were unable either to conquer the Serbs in the south or to hold back the Russians in the north of the Hapsburg Empire. Germany was now compelled to fight the war on two fronts, shifting her troops back and forth as occasion required, and finding her magnificent strategic railways of incalculable value. Skillful distribution of forces, able generalship, and superior equipment enabled the Germans, with

* At the outbreak of the war, the Chief of the German General Staff was HELMUTH VON MOLTKE, who was born in Mecklenburg-Schwerin in 1843, served in the Franco-Prussian War of 1870-71, was attached to the General Staff as an adjutant under his famous uncle, Field Marshal von Moltke, and was appointed Chief of the General Staff and general of infantry in 1906. During the course of the War of the Nations, he was superseded in chief command of the German forces by GENERAL ERICH VON FALKENHAYN, who was born at Burg Belchau in 1861, served in China several years, acted as chief of staff of the 16th, and later of the 4th, army corps, and was appointed minister of war in 1913.

Austrian assistance, to hold back the Russian invaders, and even to take up an advanced position in Russian Poland. After five months of the war, Germany was certainly holding her own. Most of Belgium, Northeastern France, and part of Russian Poland were occupied by German troops, whereas only a small corner of Alsace and a bit of East Prussia had been lost to French or Russians. The prospect of ultimate victory for the German arms was, however, becoming rather uncertain. To be sure, the danger of a Russian "tidal wave" sweeping over Germany from the east was no longer feared; but in a long war, where endurance rather than speed of mobilization wins the victory, Germany would labor under great difficulties. Germany, with a total population of 65,000,000, Austria-Hungary with less than 50,000,000, and, later, Turkey with about 21,000,000, aggregating 136,000,000, were confronted by a coalition representing 252,000,000 of Europeans, not to speak of Russia's 20,000,000 in Siberia and the vast transmaritime empires of Great Britain and France. According to the best information obtainable, Germany had placed between 4 and 5 million men in the field by the end of the year, that is, for every 16 Germans—men, women, and children—there was 1 soldier. Germany still had second-rate fighting men and freshly maturing youths to call upon, but obviously the number was limited. France likewise was limited; an army of 5,000,000 would be one-eighth the population. But Russia boasted, in addition to 5,000,000 trained warriors, a reserve of population which could furnish 5,000,000 more (counting 1 soldier to every 16 inhabitants) if they could be mustered, trained, and equipped. Great Britain, with a population of over 45,000,000 to draw upon, was already drilling 1,000,000 or more recruits to take part in the battles of France. From the 15,000,000 white inhabitants of Canada, Australia, New Zealand, and South Africa, 100,000 or more soldiers might be sent to the battlefields of western Europe. The contingents of "native" soldiers brought from Africa by Great Britain and France, and the British Indians, were picturesque, but hardly numerous enough to exert an appreciable influence on the final issue. In short, the allies appeared to possess superior resources of men and munitions for the conduct of a protracted war. If joined by Italy, or by one of the Balkan States, the Allies would enjoy a still more marked advantage. Or again, if Austria-Hungary should be rent by internal dissensions, Germany would be left to fight against overwhelming odds. On the other hand, one of the Allies might conceivably refuse to make further sacrifices, and either make peace or carry on the war in a half-hearted fashion. Or German generalship might win a brilliant victory and destroy part of the Allied army. Into any forecast of the war's outcome, these and similar considerations were bound to inject a considerable amount of uncertainty. The possibility that the Allies would capitulate separately, however, appeared very slight indeed after the agreement signed in London, September 5, by Russia, France, and Great Britain, binding themselves not to make terms with Germany until they could do so jointly.

MOBILIZATION. Before military operations on a large scale could be inaugurated in any theatre of the war, the millions of men composing the

"citizen armies" of the various belligerents had to be equipped for war and sent to the front, or "mobilized." In time of peace each nation had troops scattered in towns and camps all over the country. Take Germany for example. Germany's standing or "peace army" was composed of about 830,000 men (not including 30,000 or more civilian employees), organized in 25 army corps. On a peace footing, an army corps numbered between 30,000 and 35,000 men. For war the army corps was raised to a strength of about 50,000 men by the inclusion of "active reserves," i.e., men who had recently served and were still under 28 years of age. This gave Germany a field army of over 1,250,000 trained men. In the second place, the Landwehr or second line, consisting of trained men between 28 and 39 years of age, was called up to reinforce the first line, or to do garrison duty. The German Landwehr numbered about 1,200,000 men. The third line or Landsturm included 400,000 men of middle age, who would be called upon only for defense against foreign invasion. In addition, Germany had almost 500,000 able-bodied men of military age who had been excused from regular military service and could be used in case of war to replace the wounded and killed. War, therefore, meant possible military service for some member of almost every family. The word of mobilization, flashed by telegraph to every corner of the German Empire on August 1, brought the active reserves immediately to the appointed mobilizing centre of each army corps. Some German corps were mobilized near the frontier, for example, the XV at Strassburg, the XVI at Metz, the XXI at Saarburg, the VIII at Coblenz. Others had to be transported by rail from the interior. The immensity of this movement may be faintly realized when one considers that an army corps requires between 25 and 30 50-car railroad trains for its transportation. Guns, rations, ammunition, artillery, hospital supplies, and horses went with the troops. In many cases the horses had to be purchased from farmers at the beginning of mobilization, and motor trucks from merchants. The whole railway system was operated by military authorities, on a special time schedule carefully calculated to bring the troops to the front in the shortest possible time. The huge national army was a perfect mechanism, whose delicate adjustments might be thrown into fatal confusion by the blunder of one stupid official, the delay of one special train. Travelers who witnessed the German armies concentrating on the French frontier affirm that the marvelous German mobilization progressed with the precision of clockwork. In France, in Austria-Hungary, and in Russia, mobilization was slower and less perfect in its appointments. But most reports confirm the impression that both the French and Russian armies were put in the field with greater celerity and with far less confusion than could have been expected.

EQUIPMENT OF THE ARMIES. No less perfect than the organization of the enormous armies was the equipment with which they fought. The War of the Nations was a battle of machines, waged with the help of every deadly device science could invent. The feature of the conflict in the Franco-Belgian theatre was the new Krupp 11-inch howitzer. (A "gun" throws its projectile in almost a straight line; a "howitzer" dis-

charges its shell at an angle of elevation varying from 15 to 45; a "mortar" is fired at a still greater angle of elevation, the object being to drop a shell on the top of a fortification or behind the earthworks of the enemy.) The new Krupp howitzer, weighing nearly 40 tons, was hauled by powerful motors on two heavy motor trucks whose "caterpillar" wheels were shod with great flapping feet so as not to sink in soft ground. Arriving at the scene of action, the two trucks were backed up together and the howitzer was ready to throw an 11-inch shell at any object within a radius of six miles. The heaviest portable French siege piece had been the 10.7-inch howitzer, drawn in four parts, and difficult to move, assemble, and mount. Still more formidable than the Krupp "11" was the Austrian 12-inch howitzer, built at the Skoda works. But the surpassing achievement of the Krupp gun factory at Essen was the production of a 16-inch (42-centimeter) siege piece which could be transported by rail and readily emplaced on a concrete foundation. From this gun, discharged by electricity, a shell one meter in length, weighing almost a ton, and filled with high explosive, could be hurled some 15 miles. Skilled mechanics from the Essen works accompanied each of the 7 or 8 of these 16-inch pieces which Germany was said to have put in the field. Two of these gigantic howitzers, stationed 10 miles from the inner forts of Antwerp, rendered the elaborate defenses of that city worthless. Even the smaller German howitzers were capable of demolishing the forts at Liège and Namur and wrecking the steel-domed cupolas which had been the pride of Belgium's forts. In the field, much smaller guns were ordinarily used. The German army employed a 3-inch gun capable of throwing 20 15-pound shells per minute at an enemy three miles away. The shell was timed to explode just before striking, and would scatter 250 steel bullets in the ranks of the enemy. Gun and carriage together weighed about a ton. Aeroplanes, whose value in warfare had long been discussed, now rendered priceless service in locating the enemy, so that the artillery officers could instruct their gunners at what angle to fire at the unseen enemy. The French field gun was of slightly smaller bore than the German, but of greater power and weight. Machine guns or mitrailleuses were also used with telling effect. A machine gun is light enough to be packed on the back of a horse or drawn on a light carriage by a pair of dogs (as in the Belgian army); it fires from 400 to 500 ordinary rifle bullets per minute. The regular arm of the infantry was the rifle, tipped with the bayonet for hand-to-hand encounters. England used the excellent Lee-Enfield rifle, France the Lebel, Russia the Nagant, Belgium the Mauser, Germany the Mauser, and Austria the Mannlicher; of these various makes, the German Mauser possessed the greatest muzzle velocity, although the French had a longer effective range. Almost as important as artillery or fire-arms was the automobile. Motor cars encased in steel and armed with rapid-fire guns accompanied Von Kluck's cavalry on its swift advance. Speedy automobiles and motorcycles were invaluable for reconnaissance and communication where telephone, wireless telegraph, or aeroplane was not available. Monster searchlights mounted on motor cars illumined the field of battle by night.

The greatest service of the motor, however, was behind the firing lines. An army cannot fight unless it is fed. To feed the millions of fighting men, many thousands of motor trucks were ceaselessly employed in conveying incalculable quantities of foodstuffs. Finally, some of the most brilliant successes of the Germans were won by hurrying troops in motor trucks to the most effective point on the battle line.

ATTACK ON FRANCE. The whole French plan of defense was based on the assumption that the neutrality of Belgium and Luxembourg would be respected. To realize the importance of the neutrality of these two States, one needs only to observe that with Belgium and Luxembourg neutral, approximately half of the northwestern frontier of France was immune from attack. The southeastern half of that frontier, from Luxembourg to Switzerland, was well defended by the Vosges mountains and by the wonderful line of French fortifications from Verdun through Toul and Epinal to Belfort. French mobilization, moreover, was directed so as to place the main strength of the French army in the trenches and forts along the Franco-German frontier proper, if not actually to take the offensive in this region. If the Germans endeavored to strike into France from Lorraine, they would encounter the bulk of the French army entrenched along a strong line of defense. As events proved, the German General Staff had determined to deliver its chief attack not from Lorraine, but from Belgium and Luxembourg. By adopting this course, Germany brought 150,000 Belgians into the field as enemies and three British army corps; but the advantages gained were considered more important than the addition of 300,000 soldiers to the enemies' ranks. In the first place, through Belgium and Luxembourg, German armies would have two natural routes leading into the heart of France. The northern route, leading from the German military base of Cologne through Liège, Namur, and Maubeuge, was that of the main railway between Berlin and Paris. The network of roads and railways in Belgium and Northern France would facilitate the transportation of troops and supplies through this region, and the comparatively level country would permit the use of the famous Krupp howitzers. The second route followed the Moselle Valley from the German base of Coblenz on the Rhine up to Luxembourg and crossing Luxembourg entered France at Longwy, and passed north of Verdun. In the second place, France had not erected such formidable fortresses along the frontier opposite Belgium and Luxembourg as those opposite Lorraine and Alsace. Dunkirk, Lille, and Maubeuge could not compare with Verdun, Toul, Epinal, and Belfort. In the third place, and perhaps this was the most important consideration, a swift incursion of German armies by way of Belgium and Luxembourg would force the French army to change the front of its mobilization from the Lorraine frontier to the Belgian frontier; and in attempting to re-form its lines, the French army might conceivably be thrown into such confusion and disorder that a gigantic victory—a Sedan on a larger scale—might be won by the Germans. This was the supreme purpose of German strategy, to demoralize and break up the French field army. Paris could be taken later. Finally, the use of the Belgian and Luxembourg routes would enable the German General Staff

to put its entire effective forces immediately in the field, and use them in decisive flanking movements rather than in protracted frontal attacks. The 19 army corps which Germany had immediately available for the invasion of France were grouped in eight great armies; three were detailed to cut a broad swath through Belgium, past Maubeuge, and down the Oise; two were sent through Luxembourg and Belgian Luxembourg; and two were stationed in Alsace-Lorraine. A temporary coalition of three army corps under General von Emmich* was formed for the special purpose of seizing Liège. The eight main armies were: (1) General von Kluck's† army north of the Meuse, (2) General von Bülow's army south of the Meuse, (3) General von Hausen's army directed towards Givet, (4) the Duke of Württemberg's army just north of Luxembourg, (5) the Prussian Crown Prince's army in Luxembourg, (6) the Bavarian Crown Prince's army based on Metz, (7) General von Heeringen's‡ army based on Strassburg, (8) and General von Deimling's army in upper Alsace.

With the troops that are always stationed near the frontier, Germany was ready to make the preliminary moves in her attack on France before the main armies were under way. Even before the declaration of war, an advance guard of the Crown Prince's army took possession of the Grand Duchy of Luxembourg, August 2, and German troops were moved by the Luxembourg railways to the French frontier at Longwy. On August 2, also, a German column crossed the French border further south, at Cirey. On the following day war was declared, several raids across the frontier were reported, and a German aviator dropped bombs on Lunéville.

CONQUEST OF BELGIUM. LIÈGE AND BRUSSELS. The attack on Belgium was begun August 4, when Gen. Otto von Emmich's three army corps moved against Liège, an important city of 174,000 inhabitants, situated just across the border from the German town of Aix-la-Chapelle, strongly fortified, and lying directly in the path of the German advance from Cologne up the valley of the Meuse. So anxious were the German military authorities that Liège should be taken without loss of time, that General von Emmich recklessly sacrificed his men in futile attempts to carry Liège by assault. Compact masses of German soldiery were hurled against the Belgian forts, only to be mowed down by murderous artillery fire, or annihilated by the explosion of mines. Assault failing, General von Emmich brought up siege guns, which speedily demolished 2 of the 12 forts which encircled the city, and enabled the Germans to enter the town on the night of August 7. Some of the surrounding forts still held out—the French assert, until August 15; but they could do no more than inconvenience the passage of German troops through Liège into Central Belgium. General Leman and the gallant Belgian garrison had by their four days' resistance held back the German military machine and had given

their compatriots and allies a day or two longer to complete their mobilization.

After the fall of Liège, the German cavalry, 50,000 strong, swept over the neighboring country. Skirmishes, which the Belgians magnified into bloody battles, at Tongres, Tirlemont, Haelen, Diest, and Eghezee, marked the retirement of the Belgian forces to their principal line of defense at Louvain. There, on August 19, the Belgian army made its last important stand against overwhelming odds, was defeated, and driven back in a northwesterly direction on Malines and Antwerp. The German cavalry entered Brussels on the afternoon of August 20, without firing a shot. Then the astonished citizens of the Belgian capital witnessed the march through their city of regiment after regiment of German infantry on its way "to Paris."

FAILURE OF THE FRENCH COUNTER-OFFENSIVE. Meanwhile the French army had completed its mobilization and had begun to move forward all along the line. In the extreme south, a brigade of General Dubail's army stepped over into Alsace at Altkirch, carried the German trenches there, August 7, and entered the city of Mülhausen, August 8. General Pau* was in actual charge of the invasion of Alsace. He was hailed as a liberator by the French-speaking population, which has never ceased to long for reunion with France, although more than a generation has passed since Alsace-Lorraine was annexed by the conquering Germans in 1871. General Pau's forces penetrated as far north as Colmar. Simultaneously other French troops mastered the passes of the Vosges mountains and descended from the west into the Alsatian valleys. Further north, General Castelnau with five army corps invaded Lorraine, and occupied the line Delme-Morhange-Saarburg, August 18. Other French armies under Generals Langle de Cary and Ruffey moved up to face the Duke of Württemberg and the Prussian Crown Prince in the region of the forest of the Ardennes. A French army under General Lanrezac marched north into Belgian territory and took up a position in the angle formed between the Sambre and the Meuse rivers, south of Namur. In the meantime, two British army corps (a third, later) had been landed in France and had taken up a position north of Maubeuge on a line from Condé in France to Mons and Binche in Belgium, August 21. General Joffre,* the silent and corpulent commander-in-chief of the Republican armies, still held a considerable portion of his forces in reserve, waiting until the German plan of campaign should have disclosed itself. In the four days August 20-21-22-23 the advanced Franco-British lines felt the first shock of the German attack, and the French counter-offensive in Alsace-Lorraine definitely failed. In Lorraine, General Castelnau's invading army was attacked from three sides at once by General von Heeringen, the Crown Prince of Bavaria, and garrison forces from Metz. For the first time under fire, one French army corps suddenly gave way, and General Castelnau was

able to extricate his defeated army only with the greatest difficulty. He now took the defensive before Nancy. In southern Alsace, the French invaders were compelled to retreat as rapidly as they had advanced, and to abandon practically all the ground they had won. The French "counter-offensive" in Alsace-Lorraine had been politically advantageous, in that it had stirred up all France to reconquer the "lost provinces"; but from a military standpoint it had been unsuccessful if not disastrous. The French armies of General Ruffey and Gen. Langle de Cary, which had taken up an advanced position in the forests of Belgian Luxemburg (the southeastern corner of Belgium) were thrown back on the French frontier by vigorous onslaughts from the Grand Duke Albert of Württemberg and the Crown Prince of Prussia. This retreat left the right wing of General Lanrezac's army unsupported, and caused him to withdraw from the Namur salient, against which the Germans had brought heavy pressure to bear. To the west of General Lanrezac, British forces had been stationed; their defeat and rapid retirement was the most spectacular feature of the general strategic retreat which General Joffre now conducted. To make clear its significance, a few words may be said about the situation in Belgium.

MONS AND NAMUR. In occupying Liège (August 7), Brussels (August 20), and Ghent (August 21), the Germans had possessed themselves of three commanding railway centres, invaluable for the invasion of France. The Belgian field army had been brushed aside, separated from its allies, and driven back towards Malines and Antwerp, where it could be watched by a German reserve corps. To the south, however, the roads to France were still barred by the fortresses of Lille and Maubeuge, just across the border in France and Namur, on the Meuse River in Belgium. Behind Namur, a strong French army was supposed to be entrenched in the angle of the Meuse and Sambre rivers, with its wings at Dinant and Charleroi. North of Maubeuge, and between Charleroi and Lille, two British army corps* had arrived on August 21, and taken position along a line from Condé through Mons to Binche. Against this Franco-Belgo-British line, the army of Von Kluck was hurled. Namur succumbed to the German siege howitzers on August 22. The French force behind Namur, menaced on its right flank and strongly attacked on its left, fell back, after a savage struggle at Charleroi on August 22-23. Three German army corps appeared in front of General French's British Expeditionary Force, and one on its left flank. Obviously General von Kluck intended to overwhelm the two British army corps and turn the flank of the Allied line. Unwilling to be either outflanked or over-

* PAUL PAU, born at Montélimar, 1848; brigadier general, 1897; commander of the 16th, and subsequently of the 20th, army corps.

* JOSEPH JOFFRE, born in 1852, served in defense of Paris in the Franco-Prussian War of 1870-71, subsequently employed in the construction of forts at Enghien and in Cochinchina, won renown as military governor of Madagascar, and is famed for his fondness of mathematics and for his strict discipline.

* The Commander-in-Chief of the British Expeditionary Force was FIELD MARSHAL SIR JOHN FRENCH, who was born in 1852; served in the navy four years and then in the Sudan military campaign of 1884-85; was a commander in the Boer War, 1899-1902; commander of the first army corps, 1901-07; field marshal, 1913; chief of the British General Staff since 1911. Under Sir John French, LIEUT. GEN. SIR DOUGLAS HAIG commanded the first of the two British army corps: he was born in 1861; served in the Sudan and in South Africa; chief of the Indian Staff, 1909-12. GEN. SIR HORACE SMITH-DORRELEN commanded the other British army corps: he was born in 1858; served in the Zulu War, in the Sudan, in India, and in South Africa; general since 1912.

BRITISH AND FRENCH COMMANDERS IN THE WAR

whelmed, General French abandoned his precarious position after a hot contest at Mons, August 23-24, and conducted a hasty retreat—an orderly flight, one might say—back into France. Trenches had been prepared at the line Cambrai-Le Cateau-Landrecies, south of Maubeuge; but the continued pressure of General von Kluck's superior numbers forced the British on July 26 to continue their flight, until on August 28 they rested on the line Noyon-Chauny-La Fère, having, in the words of General French, "thrown off the weight of the enemy's pursuit." In the six-day retreat, hotly pursued by General von Kluck's cavalry and his armored motor cars, struggling desperately to prevent its artillery and supply train from falling into the enemy's hands, the little British army had lost 230 officers and 13,413 men, and inflicted, so they claimed, a loss three times as great upon their pursuers.

JOFFRE'S RETREAT TO THE MARNE. The sensational retreat of Sir John French should be regarded as one detail of the general strategic retreat ordered by General Joffre after the French defeats of August 20-23. The fate of the French army depended upon avoiding a decisive battle until the French forces could be concentrated upon an advantageous battle line and confront the Germans with equal or superior numbers. It would have been folly to rush troops northward to sure defeat. General Joffre, therefore, ordered a strategic retreat to the region south of the Marne River. All France north of a line from Paris to Verdun was abandoned to the German invaders. The French Government Offices were removed from Paris to Bordeaux; General Gallieni* began to prepare Paris for siege; and as General von Kluck swiftly followed the British southward towards Paris, until the noise of battle could be heard by the Parisians, the prediction seemed about to be verified that the Germans would be in Paris six weeks after the declaration of war. But General von Kluck, having arrived before Paris, suddenly swerved, September 4, to the east and marched towards Meaux and Coulommiers. Meanwhile the Crown Prince's army had captured Longwy, August 27, and Montmédy, and the whole German line had swept down over Northern France.

BATTLE OF THE MARNE (September 6-10). After their long and exhausting retreat the Franco-British armies stood with their left resting securely on Paris, their right holding to Verdun, and their centre sagging south of the Marne River on the line Montmirail, Sézanne, La Fère Champenoise, Camp de Mailly, Vitry le François, Revigny. In reality Verdun was the centre rather than the extreme right of the French line, for the armies of Generals Castelnau and Dubail extended south from Verdun to the Swiss frontier in a line at right angles with the Paris-Verdun line. Between Paris and Verdun, along the main line of battle, the Allies disposed of considerably more than 1,000,000 men, while the Germans numbered but 900,000. For the first time, the German advance felt the shock of determined resistance; in the evening of September 5 General Joffre had given the order to attack, "to die rather than retreat." By shift-

ing their right wing eastward, the Germans had concentrated the force of their blow against the centre of the Verdun-Paris line, between Vitry le François and Sézanne. If the Germans could break through the French centre the French army would be cut in two, and the eastern half ground to pieces against the German lines south-east of Verdun. The French centre stood solid against the German onset, however, and the battle of the Marne, September 6-10, marked the culmination and the decline of the German invasion. The decisive factor was the formation of a new French army out of three active and four second line divisions from Paris (a division is a third of an army corps, or about 15,000 men), which on September 7 moved out eastward from Paris, in the rear and on the right of General von Kluck's army. Turning west to confront these new assailants, General von Kluck was attacked from the south by the English army. With admirable generalship, and by dint of desperate fighting, Von Kluck escaped from the jaws of the Anglo-French trap and raced northwards to shake off the French forces which clung to his right flank. With General von Kluck, the whole German line fell back of necessity across the Marne River, as its right wing had been turned. The supreme effort of the German army had failed. The field army of France remained intact, and was now numerically superior.

BATTLE OF THE AISNE. With characteristic thoroughness, the Germans had prepared in their rear a strong line upon which to fall back in case of defeat. When the British and French rushed north on the heels of General von Kluck after the battle of the Marne, they were halted abruptly on September 12 at Soissons on the Aisne River. By September 15 it was clear that the Germans were not simply pausing in their retreat, but were occupying a predetermined battle line of great natural strength, prepared with trenches for infantry and concrete foundations for the big German guns. From the hills of Noyon, just north of where the Aisne River flows into the Oise, the line followed the heights on the northern bank of the Aisne—where the French had placed the forts of La Fère and Laon—and then, leaving the Aisne, the line bent southward almost touching Reims and extending across the forested ridge of the Argonne to the region of Verdun. The French drive was directed northward against Laon, the German drive southward against Reims. Both were checked. After an excessively vigorous bombardment of Reims on September 28, the battle along the Aisne practically came to a close, although the opposing armies viewed each other fiercely from their parallel lines of trenches. While the armies in the centre were coming to a deadlock, events of great interest were transpiring on both wings. On the east, the Crown Prince sent about four army corps to cut in south of Verdun from the east. The Germans had already reduced the fort of Troyon, just south of Verdun, to a heap of ruins, and had reached St.-Mihiel, September 26, a little further south on the Meuse, thus threatening to surround the fortress, when the French reinforced their line at this point. St.-Mihiel continued, however, to be a possible starting point for a strong German aggressive. On the west of the long battle line, the Germans and the French engaged in a "race to the sea." French

* JOSEPH GALLIENI, born 1849; served in the French Sudan and Indo-China; Governor-General of Madagascar, 1896-1905; commander of the garrison of Paris since the outbreak of the war.

troops were hurried northward by way of Amiens with the hope of enveloping the right wing of General von Kluck's army, and German troops were marched hastily northward to frustrate the French flanking movement. The net result was the extension of the battle line from the confluence of the Aisne and the Oise rivers to Flanders and the Channel coast. French reserve troops, detachments from the French active army, the British Expeditionary Force, British Indians, Senegalese, and Turcos went to make up this prolongation of the Allies' front.

FALL OF ANTWERP. Since the last days of August the Belgian army had been annoying the Germans by occasionally sallying forth from their position at Malines and Antwerp. On September 27 the Germans bombarded and occupied Malines, and on the following day began in earnest to attack the forts surrounding the supposedly impregnable Belgian stronghold of Antwerp. On September 29 one of the outlying forts was put out of action, and another blown up by the explosion of its magazine. A few British marines and bluejackets were hurried to reinforce the Antwerp garrison, but to no avail, for the German howitzers, and above all the 42-centimeter siege pieces, were pounding the Belgian fortifications to bits. It was not necessary for the Germans to surround and besiege the city; they had simply to batter the forts and drive the Belgians out by artillery fire. During the night of October 8 the Belgian and British forces forsook the doomed city, and on the following day the Germans entered in triumph. The Belgian army then took up a position on the Allied line in Flanders.

BATTLE IN FLANDERS. In the last week of October there began a terrific battle in Flanders. Having taken Antwerp, the Germans massed 12 army and 4 cavalry corps between the Lys River and the sea for a drive towards the French seaports of Dunkirk and Calais. The Allies had to hold their line at all costs, or permit the Germans to gain a foothold on the Channel whence England would be menaced and the Allied flank attacked. The brunt of the battle was borne at first by the battered Belgian army, which held the Germans back of the Yser River at Nieuport until British warships could draw into range and open fire with their heavy guns, forcing the Germans to desist. Further inland, between Nieuport and Ypres, the German advance was checked, after all other means had failed, by the desperate expedient of cutting the dykes and flooding the country. The town of Dixmunde, in this region, was finally won by the Germans after terrible fighting. At Ypres, the British army was savagely assailed and beaten back, but its line was not broken. While villages and cottages were being laid in ruins by incessant bombardment, the contending armies sought shelter in trenches. By the end of November, the battle of Flanders, like the battle of the Aisne, had lost its fury and become a dreary process of trench-digging. Here and there, a few hundred yards could be gained by one side or the other, by hurling masses of infantry at the opposing trenches; but for such sacrifice of life, the strategic gain was small. The rigors of winter, moreover, had added to the sufferings of the soldiers, who had to settle down in trenches often filled with water. Newspapers and gifts from home, and a

liberal supply of tobacco, contributed to make more endurable a cruel experience.

"GERMAN ATROCITIES" IN FRANCE AND BELGIUM. No sooner had the German invasion of Belgium and France begun than reports began to come in from the invaded countries alleging that the Germans were committing the most horrible atrocities and outdoing the Huns in ferocity. First of all, the Germans were charged with using dum-dum bullets, i.e., soft-nosed bullets which spread on impact and produce a gaping and needlessly brutal wound. The Germans replied by accusing the French and British of the same offense; and in the confusion of contradictions the truth was somewhat difficult to discern. Similarly the crime of killing wounded soldiers in cold blood was charged against each side by the other. Other acts of the Germans, however, were comparatively well substantiated. The beautiful cathedral at Reims was bombarded because the French were alleged to have established an observation post in its tower. The Belgian city of Louvain, with its wonderful University and its Church of St. Pierre, was deliberately burned by the Germans, because, said the German official report, the civilian population had concerted an attack on the German troops which occupied the town. The case of Louvain figured largely in the American press, but it was only one of numerous similar instances where towns or villages had been ruthlessly burned, and many of their inhabitants shot, because they resisted the invaders. The spirit which prompted these acts may be judged by the following extract from General von Bülow's proclamation to the inhabitants of Liège: "The inhabitants of the town of Andenne, after having declared their peaceful intentions, have made a surprise attack on our troops. It is with my consent that the commander-in-chief has ordered the whole town to be burned and that about 100 people have been shot. I bring this to the knowledge of the city of Liège, so that the citizens of Liège may realize the fate with which they are menaced if they adopt a similar attitude." Similarly at Namur the Germans took hostages from the civilians and warned the population, "If any outrage is committed in the street the 10 hostages will be shot." In the city of Wavre, it is alleged, the German general demanded a war levy of 3,000,000 francs as a fine for the resistance offered by the inhabitants, and threatened, "The city of Wavre will be burned and destroyed if the levy is not paid in due time, without regard for any one; the innocent will suffer with the guilty." This was precisely the most distressing circumstance, that the innocent were made to suffer with the guilty. Evidence collected on oath by a French commission of inquiry tended to show that in countless cases the horrors of war had been brought home to innocent women and children. For instance, at Sommeilles, which was burned by the Germans on September 6, two women, and four children, aged respectively 11, 5, 4, and 1½ years, were afterwards discovered lying in a pool of blood in a cellar where they had been cruelly butchered. For such cases, the German officers could not always be held responsible, for in spite of the strictest discipline dastardly acts will be committed by the occasional criminal in the ranks of any army. As German officers frequently replied to protests, "It is war."

POLISH THEATRE OF WAR. During the first few months of the War of the Nations, France, Britain, and Belgium looked for Russia to invade Germany with her vast armies and force Germany to turn her attention to the east. It was generally assumed that if the Allies could hold out until Russia's forces were mobilized, the Russian armies would sweep like a tidal wave towards Berlin, while the weakened German line in the west would be beaten back out of France and Belgium. But month after month dragged by, and although the fighting forces surged back and forth on the eastern frontier of Germany, there was no sign of the "tidal wave." In order to understand the failure of the Russians to overwhelm Germany in the east, one must realize that Russia had to battle not only against the well-trained and perfectly-equipped soldiers of Germany, and the somewhat less efficient soldiers of Austria-Hungary, but also against geography. European Russia, it will be observed, forms roughly a huge wedge, with Russian Poland as the rather blunt point of the wedge, thrust in between German East Prussia on the north and Austrian Galicia on the south. The point of the wedge is only 200 miles from Berlin, but before the wedge could be driven into Germany, the Germans would have to be crowded out of East Prussia and the Austrians out of Galicia. In other words, no army would be safe in proceeding from Russian Poland against Berlin, as long as the Germans from the north and the Austrians from the south could close in and cut off the communications of that army with its sources of supply in Russia. For this reason, the chief Russian armies, instead of marching straight westward from Warsaw to Berlin, were deflected to the north and to the south.

Immediately upon the declaration of war, August 1, followed numerous engagements all along the frontier; these were merely skirmishes between the "covering troops," principally cavalry, which screen the mobilization and advance of the main armies. By August 10, the four army corps of the Warsaw district were ready for action in Russian Poland; and four more were simultaneously mobilized in the Vilna district, opposite East Prussia. By August 21, 18 more Russian army corps had come up: 4 from Petrograd, 5 from Moscow, 2 from Kazan, 5 from Kiev, and 2 from Odessa. Of these 26 army corps, 8 were detailed to deal with the 5 army corps left in the east by Germany, and 18 were massed against the Austrians' 12.

Let us take first the campaign against the Germans, in the north. In invading East Prussia, the Russians had to overcome three serious obstacles. First there was a chain of almost impassable lakes, marshes, and rivers stretching from Johannisberg to Insterburg. Behind this lake barrier lay the fortified camp of Königsberg with one German army corps, in the north, and Allenstein, with another army corps, in the south (about 30 miles north of the frontier). Still further west was the strong line of the Vistula River, defended by Danzig, Marienburg, Graudenz, and Thorn. Apparently the main bodies of Russian troops avoided the lake country near the eastern frontier of East Prussia. One Russian army proceeded directly westward from Kovno, defeated the Germans at Gumbinnen (August 17-23), pressed on to Insterburg, and drove the Königsberg army corps back into

the shelter of its fortifications. Simultaneously 4 or 5 Russian corps invaded East Prussia from the south, between the lake barrier on the east and the Vistula on the west, and with irresistible impetus pressed back the two German army corps towards the line of the Vistula. But suddenly the Russians discovered on their rear and flank two fresh German army corps, which had been hastily transported by rail from Belgium and detrained near Allenstein. In the battle that then took place, August 29-31, in the neighborhood of Allenstein, Ortlesburg, and Tannenberg, two Russian army corps were completely routed. At the end of the three days' fighting the German general Von Hindenburg* could report the capture of 70,000 Russians, including 2 generals, 300 officers, and the equipment of two whole army corps. The news arrived in Berlin in time to transform the anniversary of Sedan (September 1) into a triumphal celebration of Von Hindenburg's gigantic victory. General von Hindenburg followed up his success by driving the Russians completely out of East Prussia.

In their invasion of Austrian Galicia, in the south of the Polish theatre of war, the Russians were more successful, although here, too, the terrain was unfavorable. The broad and desolate Pinsk marshes, on the southern boundary of Poland, had to be avoided; river after river had to be crossed under the fire of Austrian guns; and very strong Austrian positions had to be encountered at Lemberg (between the Bug and the San rivers), at Jaroslav and Przemyśl (on the San River), and at Cracow (on the Vistula). By August 10, 12 Austrian corps had been mobilized in Galicia: two of them marched northeast along the railway from Cracow towards Kielce in Russian Poland, west of the Vistula; seven advanced in a northeasterly direction from the San River against Lublin and Chelm in Russian Poland; and three were stationed east of Lemberg. The three last-mentioned army corps, constituting the Austrian right, even when reinforced by troops of the seventh, thirteenth, and fourteenth army corps, and by several brigades of the Landsturm, proved incapable of detaining the Russian armies which swept up the valley of the Dniester and overran all the eastern half of Galicia. Against Lemberg, which is both an important entrenched camp and the centre of the Galician railway system, the Russian armies commanded by General Ruzsky advanced in force, inflicting—by Russian report—a severe defeat on the Austrian armies which attempted to defend the city. The Austrians represented their evacuation of Lemberg as a strategic retreat. At any rate, the Russians took possession of the city on September 2 and gave it the genuinely Slavic name of Lvov. Halicz and Nickolaiev, south of Lvov, fell a few days later. Now if the Russians advanced westward from Lvov they would cut off the retreat of the central Austrian army, which had won a battle at Kraśnik in Russian Poland, August 23-26, and had advanced victoriously into Poland almost as far as Lublin. In the first week of September the Russians, attacking from the east and from the north, made their grand attempt

* FIELD MARSHAL PAUL VON BENCKENDORFF UND VON HINDENBURG, German commander-in-chief in the east. The Russian operations in East Prussia were conducted by GENERAL RENNKAMPFF, under the general direction of the GRAND DUKE NICHOLAS NICHOLAEVITCH, Russian generalissimo.

to rout this main Austrian army. On a battle line 175 miles long 1,000,000 Austrians fought 1,500,000 Russians. The Russians registered important successes at Zolkiev a few miles north of Lvov, September 4, at Rawaruska, further to the northwest, September 6-8, and at Tomaszov, still further to the northwest, just across the Polish frontier. These points lie approximately on a line running northwest from Lvov in Galicia to Lublin in Russian Poland. A little less than 50 miles southwest of the Lublin-Lvov line and parallel to it flows the San River, defended against attack from the direction of Lvov by the two strong fortresses of Przemyśl and Jaroslav. This was perhaps the strongest defensive position in Galicia, as an army taking up the line of the San would have its flanks protected by the Vistula River in the north and the Carpathian Mountains in the south. In a mad retreat that may well have been a rout the Austrian right fled eastward and the Austrian centre fell back southward to the San and the angle between the San and the Vistula. There the battered Austrian army might hope to reform its lines, while the forts at Jaroslav and Przemyśl held back the Russians. But Jaroslav fell on September 23, and although Przemyśl still held out against an encircling ring of Russians, the line of the San had to be abandoned. Eighty miles further west, at Tarnow, where the Donajec River flows north across Galicia, the Austrians rallied for a last stand before Cracow. Their field army had been badly mauled, in spite of the support given by two German army corps in Western Poland and the return of the two Austrian army corps which had been sent to France at the opening of the war. The Russians were now masters of most of Galicia and were sending their cavalry on raids across the Carpathians into Northern Hungary, and down into Bukovina, southeast of Galicia.

It will be remembered that before the Russians could safely advance on Germany from Warsaw they would have to clear the Austrians out of Galicia, and the Germans out of East Prussia; then with one flank resting on the Carpathian Mountains and the other on the Baltic Sea, the Russian army might begin its grand march on Berlin. The one part of this task, the conquest of Galicia, had been well-nigh completed. But in the north, the Germans, far from being driven out of East Prussia, had actually taken the offensive. At least three, and possibly as many as six, German army corps had been rushed from the Franco-Belgian theatre to reinforce General von Hindenburg's army. In the latter part of September he felt strong enough to undertake an invasion of Russian Poland in the direction of Byelostok. If successful, his move would cut the important railway line which connected Petrograd with Vilna and Warsaw. The Russians met him and checked him at Augustowo, where a sequence of heavy engagements occurred in October. The second week in October witnessed an advance of German and Austrian forces into Western Poland, against Warsaw. In the same week the Russian aggressive in Galicia was abandoned. Late in October fresh Russian troops came up, and the Russians made advances along the whole front, in Galicia, in Western Poland, and in the region of Augustowo. Jaroslav, which had been temporarily abandoned, was now retaken. In East Prussia, the Russians again assumed the

rôle of invaders, taking Wirballen, Goldap, Angerburg, and Gumbinnen, in November. Throughout November the German and Austrian forces in Western Poland continued their efforts to reach Warsaw, and a series of big battles were fought in the region west of Warsaw. Early in December, the Germans claimed that they had broken through the Russian lines southwest of Warsaw at Lodz and had captured 100,000 Russian prisoners. On December 18 the Russians admitted that their line in Poland had been compelled to fall back, but ascribed the retreat to strategy rather than to defeat. The Austrians, apparently, had flung their forces as far north as Przedsborz and Piotrkow, while the Germans held the battle line north of Piotrkow in front of Lowicz and Skierniewice, confronting the Russians, who stood behind the Bzura. In Galicia, the Russian armies which had been closing in upon Cracow again fell back, until they reached the Nida. In Bukovina, strong Austrian forces were threatening the extreme left wing of the Russian line. The situation after five months of fighting in the Polish theatre of operations was not, then, exactly encouraging for the Russians. They had had time to bring their troops from farthest Siberia; they had engaged in protracted and costly battles; and still there were unconquered German armies in East Prussia and in Russian Poland. The great achievement of the Russian campaign had been the shattering of the Austro-Hungarian army in Galicia, although it could not yet be said that the Austro-Hungarian army had been completely demoralized. In addition, the Russians had drawn about half of the German forces to the east, that is, about 48 army corps, and thus prevented Germany from continuing her vigorous aggressiveness in France.

PLIGHT OF THE POLISH NATION. In reading the history of the military operations in the Polish theatre of war, one should not entirely forget the tragic plight of the Polish nation. The once glorious kingdom of Poland, it will be remembered, had been partitioned at the end of the eighteenth century between Russia, Prussia, and Austria. Consequently, although the Poles constituted a homogeneous nation of 23,000,000, possessing a national literature, a common language and religion (Roman Catholic), occupying the plains of Russian Poland, Prussian Posen, and Austrian Galicia, and passionately desiring to restore their political unity and freedom, they were now compelled to fight in the three opposing armies, and to furnish the battleground for Russia, Germany, and Austria-Hungary. The march and counter-march of millions of soldiers, and the havoc wrought by hundreds of huge howitzers, devastated Poland more completely than Belgium. Without food or homes the Polish peasants perished miserably. Yet for the future, perhaps a slight ray of hope could be discerned. Russia, long the cruel oppressor of the largest section of Poland, now feared a Polish revolt and promised Poland autonomy in return for loyalty. Early in August the Russian commander-in-chief, Grand Duke Nicholas, issued the following eloquent manifesto to the Poles:

"The hour has sounded when the sacred dream of your fathers may be realized. A hundred years ago the living body of Poland was torn to pieces, but her soul survived and she lived in hope that for the Polish people would come

an hour of regeneration and reconciliation with Russia. The Russian army brings you the solemn news of this reconciliation, which effaces the frontiers severing the Polish people, whom it unites conjointly under the sceptre of the Czar of Russia. Under this sceptre Poland will be born again, free in her religion and her language, and autonomous. Russia expects from you only the loyalty to which history has bound you. With open heart and a brotherly hand extended, great Russia comes to meet you. She believes that the sword which struck her enemies at Gruenewald is not yet rusted. Russia from the shores of the Pacific Ocean to the North Sea marches in arms. The dawn of a new life commences for you. In this glorious dawn is seen the sign of the Cross—the symbol of the suffering and the Resurrection of a people." Similar appeals to the Poles were made by Austria-Hungary, who had undoubtedly accorded the Poles within her borders far better treatment than was received by the unfortunate Poles in Prussia or in Russia. As far as Prussia was concerned, no promise could efface from their memory the wrongs suffered under the harsh Prussian administration, which had pursued a deliberate policy of settling Germans on the land formerly owned by Poles.

CAMPAIGN AGAINST SERBIA. Even had Austria-Hungary been able to send all her armies south to "punish" Serbia, her task would not have been altogether an easy one; when, however, the greater part of the Austro-Hungarian forces had to be used for defense against Russia, the campaign against Serbia became extremely difficult. The little Slav State, poor and small as it might appear, could boast a war army of 250,000 men, mostly seasoned veterans, besides a territorial reserve of 50,000; Serbia's ally, Montenegro, moreover, could place in the field about 50,000 hardy mountaineers, renowned for their valor. In spite of the fact that Serbia lacked big guns, aeroplanes, and sanitary service, and in spite of the shortage of modern rifles in the Serbian army, the immense advantage of recent experience in war, and the glowing memory of victories at Kumanovo (1912) and at Bregalnitz (1913), gave the Servians good reason to enter the conflict with confident courage. The mobilization of the Serbian forces, ordered on July 25, was accomplished with such alacrity that by the 28th, when Austria-Hungary declared war, 10,000 soldiers were available in the vicinity of Belgrade, to keep that city from falling into the hands of Austrian invaders. Belgrade, as a glance at the map will show, lies at the junction of the Save and Danube rivers, and divides the northern frontier of Serbia into two sections. East of Belgrade the broad Danube forms the boundary between Serbia and Hungary; west of Belgrade the Save separates Serbia from Croatia-Slavonia; flowing into the Save from the south, the Drina River marks off Serbia from Bosnia on the west. Serbia's main forces were initially concentrated at Lazarevatz, Arangelovatz, and Palanka, on a line just south of Obrenovatz, Belgrade, and Semendria. The reason will be clear to any one who observes that Obrenovatz, Belgrade, and Semendria command three railways and two river valleys leading from the Austro-Hungarian frontier southwards into the heart of Serbia. Other forces were distributed along the frontier to guard against an unexpected attack. As a

precaution, the government offices were moved from Belgrade, upon which city the Austrians immediately opened fire, to the safer location of Kragujevac, and later to Nish. From July 29 to August 12 the Austrians contented themselves with bombarding Belgrade and making numerous but insignificant attempts to cross the frontier at various points. The first serious movement against Serbia began on August 12 and was directed not against Obrenovatz-Belgrade-Semendria, but against the northwestern corner of Serbia, in the angle formed by the Drina and Save rivers. On August 12 strong Austrian columns were thrown across the Drina River at Liubovia, at Zvornik, and at Loanitz, and across the Save River at Shabatz. Obviously the intention was to invade the northwestern corner of Serbian territory simultaneously from the north and from the west, and to converge on the Serbian military depot of Valievo. With frantic haste General Putnik, the Serbian commander-in-chief, brought his main armies by forced marches westward to meet the Austrian invasion. In the mountainous northwest corner of their country, between Shabatz on the Save and Liubovia on the Drina River, the Servians fought the "battle of the Jadar," August 16-23, to prevent the junction of the invading columns. So successful were the Serbian tactics that the Austrians were defeated at all points, and compelled to retreat into Austria-Hungary under cover of darkness on the night of August 23-24. In repelling the 200,000 Austrian invaders, the Servians had lost 3000 killed and 15,000 wounded; but they had killed some 6000 of the enemy, wounded perhaps 30,000, and captured 4000: they had, in addition, captured 48 cannon, 30 machine guns, and much needed stores of rifles and ammunition. It was now the turn of Austria-Hungary to suffer invasion. Early in September the Servians took Semlin, across the river from Belgrade; while another Serbian army struck into Southern Bosnia towards Sarajevo. These forces were withdrawn when Austria-Hungary again assumed the offensive, massing 250,000 men against the same northwest corner of Serbia. In the second week of September the Austro-Hungarians advanced on Valievo from the direction of Zvornik and Liubovia, encountering fierce resistance, and suffering a severe check on their right wing, September 15. While the fighting in Northwestern Serbia was continued, another Austrian column, only six battalions strong, attempting to invade Serbia near Semendria, was cut to pieces on November 9. On November 15, the Austrian offensive, which had begun to move forward again in Northwestern Serbia, approached Valievo in such force that the Servians fled precipitately, leaving 6000 men and large quantities of military stores to be captured. The fifth Austro-Hungarian corps, under General Frank, after having besieged Belgrade since July 29, succeeded at last in taking that city at the point of the bayonet, December 2. The Serbian army was said to have lost 100,000 men since the beginning of the war. Just when Serbia's complete collapse was momentarily expected, news was received that the Servians had broken through the centre of the advancing Austrian army, recaptured the towns of Ushitza and Valievo, and inflicted a crushing defeat on two Austrian corps, capturing 20,000 prisoners, 50 cannon, and munitions in immense quantity.

The Austrian right wing was driven back in disorder across the Drina, where it was still further punished by the Montenegrins at Vishegrad.* On December 14 the Servians recaptured Belgrade, and King Peter was able to re-enter his former capital at the head of his victorious army, while all Servia rejoiced over the announcement that not a single Austrian invader remained on Servian soil. Reports from Vienna (via Rome and London) placed the Austrian losses at 100,000 men. As December drew to its close, the Servians and Montenegrins were seen once more advancing into Bosnia.

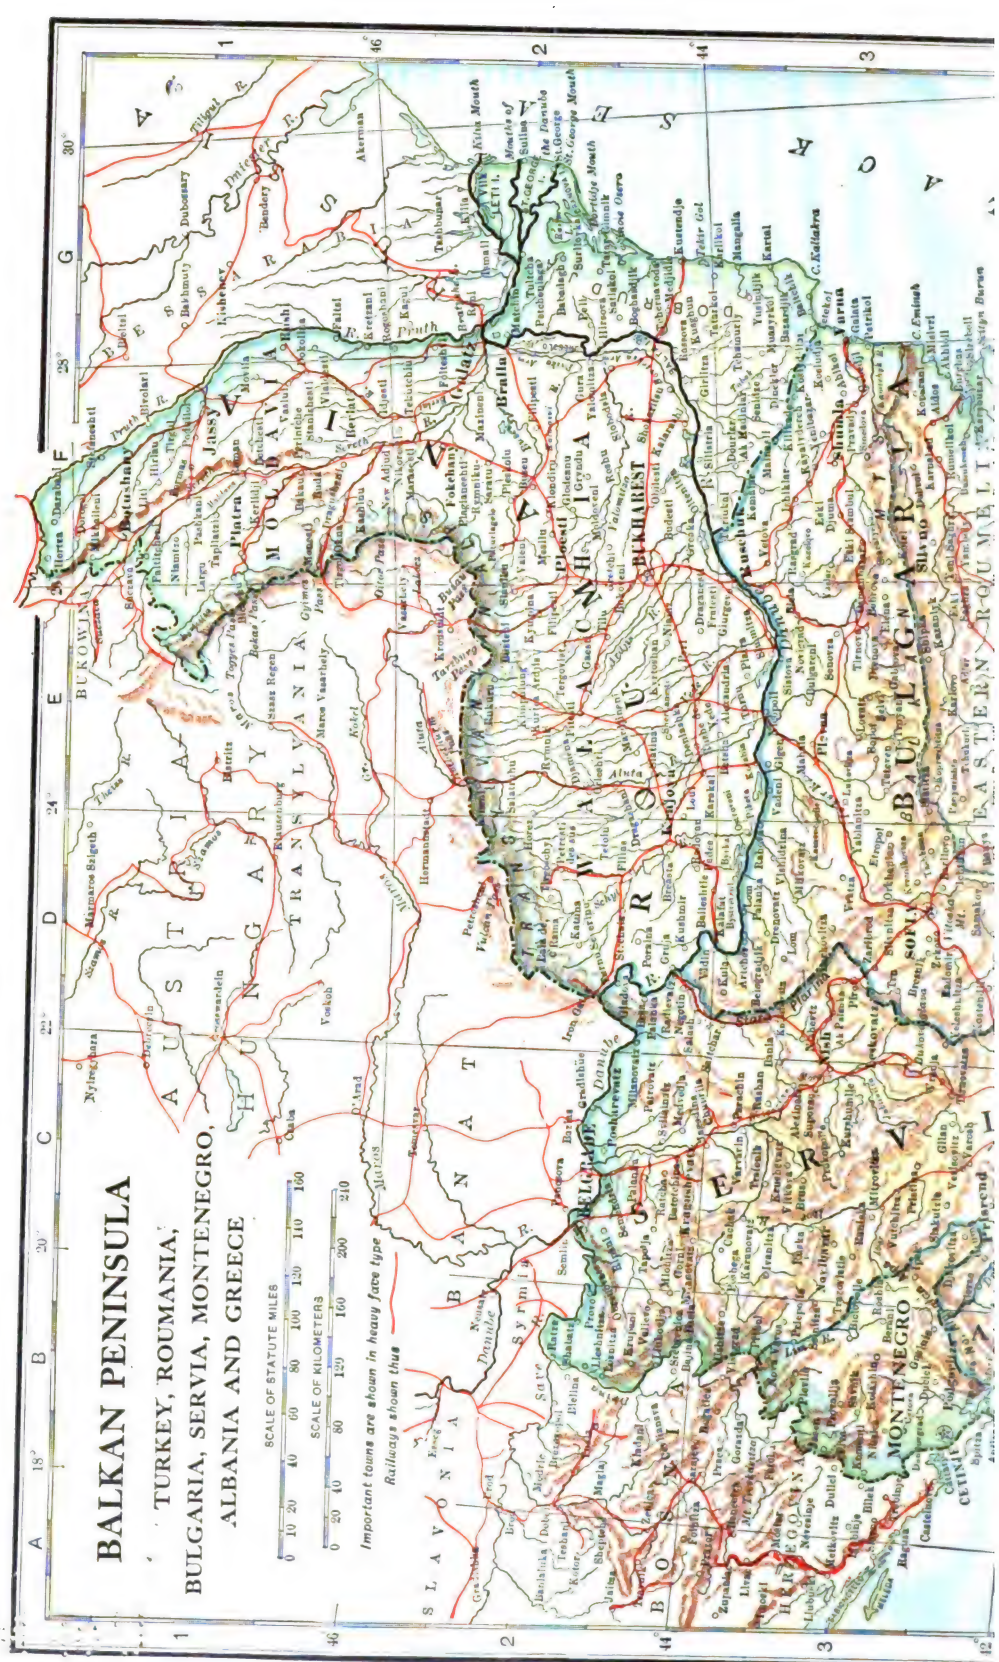

ENTRANCE OF TURKEY INTO THE WAR. In the early stages of the war, two German cruisers, the *Goeben* and the *Breslau*, sought to escape capture by entering the Dardanelles. International law prescribed that these belligerent warships should either be compelled to put out to sea again, or, if they elected to remain in Turkish waters, be interned and dismantled. The Turks, however, allowed the cruisers to lie in Turkish waters without dismantling; and presently the Porte announced that the *Goeben* and the *Breslau* had been purchased from Germany by Turkey. In defiance of protests from the Allied Powers, Turkey refused to repatriate the German crews of her newly-acquired vessels. She needed the skillful German engineers and gunners in her navy. The irritation caused by this episode was aggravated by the Porte's declaration that the Capitulations were about to be abrogated, September 10 (see **TURKEY**), and by the closing of the Dardanelles, September 28. Rumors of Turkish military preparations and reports of German officers sent to Turkey gave rise to the belief that Turkey would speedily make common cause with Germany. The failure of the Germans to achieve any decisive victory, however, and the seeming collapse of Austria-Hungary exercised a calming influence upon even the most jingoistic of the Young Turks, and counsels of caution prevailed until the end of October. On October 29, the *Breslau*, now masquerading under the name of the *Midüllü*, bombarded the Russian Black Sea port of Theodosia. The *Hamidië*, another Turkish warship, simultaneously opened fire on Novorossiisk, and Turkish torpedoes destroyed the Russian gunboat *Donets*, one French, and three Russian steamers at Odessa. These hostile acts were interpreted by Russia as inaugurating a state of war between Russia and Turkey. On October 30 the Russian ambassador asked for his passports. Belated explanations offered by the Porte were refused. A few days later, on November 5, Great Britain and France declared war on Turkey. At the same time, Great Britain formally annexed the Turkish island of Cyprus (see **CYPRUS**). Egypt also, which was nominally still a vassal State of the Sultan, was declared by Great Britain to be independent of Turkey as a result of the war. A British "White Paper" containing "Correspondence respecting the events leading to the rupture of relations with Turkey," published in November, adduced documents to show that Great Britain in August had disclaimed all intention of annexing Egypt and had promised to uphold the territorial integrity of the Ottoman Empire, on condition that Turkey

would observe scrupulous neutrality and make no attempt to foment rebellion in Egypt. Although Tewfik Pasha, the Turkish ambassador in London, had informed Sir Edward Grey, August 13, that his country would be strictly neutral, Sir Edward Grey was able on September 23 to accuse Turkey of breach of neutrality: "German officers and men," he alleged, "are participating increasingly in Turkish fleet and Dardanelles defenses, and not only has Turkey failed to send away the German officers and crews, as she promised, but she has admitted more overland, and they are now in active control of the *Goeben* and the *Breslau*. The capital is undoubtedly now under the control of the Germans. If his Majesty's government so desired, the present state of things affords ample justification for protesting against violation of neutrality." Likewise the Russian government issued another "Orange Book" containing 98 documents calculated to confirm the conviction that German influence had involved the Turkish government in war against its own better judgment. In vindication of its course, the Turkish government, in its turn, issued an apologetic *communiqué*, November 13, asserting that Great Britain's unfriendly seizure of two warships under construction for Turkey in British shipyards had made the purchase of the *Goeben* and the *Breslau* necessary to Turkey's defense. In bitter sentences the Turkish *communiqué* accused the British of acting ever as the foes of Turkey and of Islam, while pretending friendship. The Turkish Speech from the Throne, December 15, further justified Turkey's entry into the war on the ground that the Russian Black Sea fleet had—according to Turkish reports—taken the initiative in opening hostilities.

The Germans welcomed the entry of Turkey into the war for two reasons. In the first place, the Turks were expected to stir up the Moslem populations of Morocco, Algeria, Egypt, and India to engage in a Holy War against Great Britain and France. How successful the "Holy War" was in inflaming the imaginations of the Egyptians and Indians, events alone will prove; but as far as the condition of these two great British empires was known at the close of the year, there seemed to be no evidence of popular excitement. In Morocco, however, French rule was seriously menaced by Mussulman uprisings. In the second place, the Turkish army was expected to engage the attention of a considerable body of Russian and British colonial troops, who would thus be prevented from participating in the battles of Poland and France. In this respect, the Germans were not entirely disappointed, although the Turkish army won no notable victories. Several Russian army corps were engaged in the Transcaucasian region, where a strong Turkish army attempted to invade Russian territory. Confused reports of alternate Turkish invasions of Russian Transcaucasia and Persia, and Russian invasions of Turkish Armenia, indicated the continuance of heavy fighting throughout November and December in the region east of the Black Sea. In the meantime the Turks had been preparing for an invasion of Egypt. A Turkish army, whose size may well have been imposing, but whose strength it was as yet impossible to ascertain, advanced from the east across the Sinai Peninsula against the Suez Canal. The guns of British warships in the canal, and the presence of

* The Montenegrins had up to this time played a comparatively unimportant rôle, bombarding Cattaro (near Cetinje) and joining with Servian movements against Bosnia-Herzegovina.

considerable British forces in Egypt, rendered difficult the task and improbable the success of the Turkish army of invasion.

SMYRNA INCIDENT. In November the report that the Turks had fired upon the launch of the United States ship *Tennessee* at Smyrna aroused great indignation in the United States, until the Porte explained that the shots were not directed at the launch and were fired merely as a warning that the harbor was mined. For the *Hodeida* incident, see **TURKEY**.

JAPAN AND TSINGTAO. On August 19 the Japanese representative in Berlin handed to the German Foreign Office an ultimatum demanding—or, rather, “advising”—that Germany should immediately withdraw all warships from Chinese and Japanese waters and deliver up the entire leased territory of Kiaochow before Sept. 15, 1914, “with a view to the eventual restoration of the same to China.” Kiaochow, it should be understood, was a bay on the northern Chinese coast, with 117 square miles of surrounding territory, which had been seized in 1897 and then leased from China (for 99 years) by Germany as compensation for the murder of two German missionaries in China. At Tsingtao or Tsingtau (as the Germans spell it), on the leased ground, the German government had at great expense erected strong fortifications, commanding the bay; under the shelter of frowning forts the Germans had constructed a magnificent floating dock which made Tsingtao a splendid naval base. Leading back from Tsingtao through the Chinese city of Kiaochow (which must not be confused with the leased territory of Kiaochow, outside of which it lay) to Wei-Hsien and Tsi-nan, the Germans had constructed the Shantung Railway. Upon the refusal of the German government to comply with the terms of her ultimatum, Japan forthwith declared war, August 23. The reasons for this step were set forth by Baron Kato, the Japanese foreign minister as follows:

“Early in August the British government asked the Imperial government (of Japan) for assistance under the terms of the Anglo-Japanese Alliance (1905). German men-of-war and armed vessels were prowling around the seas of eastern Asia, menacing our commerce and that of our Ally, while Kiaochow was carrying out operations apparently for the purpose of constituting a base for warlike operations in eastern Asia. Grave anxiety was thus felt for the maintenance of peace in the Far East. As all are aware, the agreement and Alliance between Japan and Great Britain has for its object the consolidation and maintenance of general peace in eastern Asia and the maintenance of the independence and integrity of China, as well as the principle of equal opportunities for commerce and industry for all nations in that country, and the maintenance and defense respectively of territorial rights and special interests of contracting parties in eastern Asia. . . . Germany's possession of a base for powerful activities in one corner of the Far East was not only a serious obstacle to the maintenance of permanent peace, but also threatened the immediate interests of the Japanese Empire. The Japanese government, therefore, resolved to comply with the British request, and, if necessary, to open hostilities against Germany.”

In addition to her desire to fulfill her obligations as Great Britain's ally, Japan may also

have been actuated by the lingering resentment which had been aroused by the Kaiser's references to the Yellow Peril, and by the part Germany had played in preventing Japan from retaining Port Arthur in 1895 after the Chino-Japanese War.

Four days after the declaration of war, the Japanese navy established a blockade of Tsingtao, and mine-sweepers began the dangerous work of clearing the surrounding waters of German mines. The only losses during the continuance of the blockade were one or two small vessels used as mine-sweepers and the cruiser *Takachiho*, which was torpedoed on October 19 and sank with 243 of her crew. The importance of this blockade can hardly be exaggerated, for it prevented the German cruisers already at Tsingtao from venturing out to prey on the valuable British sea-trade around Hongkong, and it deprived the swift German cruisers in the Pacific of their most important base. On September 2, Japan landed 10,000 troops outside the German leased territory on the Shantung peninsula. This landing, and the subsequent seizure of the Shantung Railway in the Chinese hinterland, constituted a plain violation of China's neutrality, and called forth vigorous protests both from Berlin and from Peking. (See **CHINA**.) Japan replied that since the railway was owned by Germany, it was not neutral. A small British East Indian force (1360 men) under General Barnardiston arrived in September to cooperate with the Japanese landing party, which was raised to the strength of 21,000 men and 142 guns, under the command of General Kamio. On September 27, the Japanese, advancing on the Tsingtao fortifications, captured 50 men and four machine guns in the German trenches. Next day they began to plant siege guns on the heights near the town. Bombardment by two German cruisers and a sortie by the garrison, October 5, failed to dislodge the invaders. Prince Heinrich Hill, easily carried by assault, was crowned with Japanese guns which on the last day of October began the final bombardment with the aid of Japanese and British battleships. The German forts, powerful though they were, could not withstand the terrific fire. By November 6 the forts had been silenced and the word for an infantry assault was given by General Kamio. Early in the morning of November 7, the attacking party discovered that white flags had been hoisted in the city. The articles of capitulation were signed that evening, and on November 10 the governor, Meyer-Waldeck, formally handed over Kiaochow to Japan. In addition to the valuable naval base, Japan had captured 4000 German prisoners. The Japanese landing party had lost 236 killed and 1282 wounded; the British, 12 killed and 61 wounded.

GERMAN ISLANDS IN THE PACIFIC. Germany's island possessions in the Pacific Ocean, being entirely unprotected, fell an easy prey to Great Britain and Japan. German Samoa surrendered to an expeditionary force from the British colony of New Zealand, August 29. Australian troops occupied Herbertshohe, the seat of government for the German colonies of the Bismarck Archipelago and Solomon Islands, September 11, and captured Kaiser Wilhelmsland (the northeastern third of the large island of New Guinea), September 24–25. Jaluit, the most easterly of the German islands in the Caroline Archipelago, surrendered without offering resistance to Jap-

anese marines on or before October 6. Japan, in announcing this exploit, carefully explained that the island was being occupied not permanently, but solely for military purposes. Yap, at the western end of the group, was taken a day later. By October 20, Japan had possessed herself of all the Marshall Islands, the Marianne Islands (Ladrones), and the East and West Caroline archipelagos. The German flag had vanished from the South Seas.

AFRICA. Since Germany could not reinforce her colonial garrisons, her colonies in Africa were left at the mercy of their French and British neighbors. Togo, the narrow German territory on the north of the Gulf of Guinea, was attacked by British warships on August 8, and surrendered to Anglo-French forces from Gold Coast and Dahomey, August 25. Kamerun, the large German colony north of the Congo River, was likewise conquered by combined British and French forces, late in September. German South West Africa was invaded, and Lüderitz Bay captured in September by forces from the Union of South Africa; but the outbreak of the Boer rebellion in the Union (see **SOUTH AFRICA**) necessitated the recall of the South African troops and enabled the Germans to cooperate with the rebels. German East Africa was the objective of several British attacks—it borders on two British colonies—but defended itself vigorously. (See **GERMAN EAST AFRICA**.) Nor were the Germans entirely on the defensive. From Southwest Africa they encouraged and assisted the rebel attacks on British South Africa, and sent German forces north to invade Portuguese Angola, if Portuguese accounts may be credited. Belgian Congo, too, was attacked. This fighting in the southern half of Africa was insignificant both with regard to the numbers engaged, and in respect of its result. The fate of Germany's African colonies depended not upon the success of raids from neighboring colonies, but on the outcome of the tremendous battles in Europe. In one way, however, the disturbances in Africa were an advantage to the Germans, inasmuch as the Allies were compelled to retain in Africa troops which might otherwise have been marshaled against the German armies in France. For this reason the German press was inclined to regard with complacency the civil war in British South Africa, the activity of the Moroccan tribesmen, and the incitement of the Mohammedans in Egypt to aid Turkey in the "Holy War."

V. NAVAL OPERATIONS

BRITISH SUPREMACY ON THE HIGH SEAS. Overawed by the enormous superiority of the mighty British navy, the main German fleets refused to venture out into the North Sea. British supremacy on the high seas was not seriously challenged. Two German cruisers left in the Mediterranean raced to shelter in the Dardanelles; a few of Germany's swifter ships for a time played havoc with British commerce in the Pacific, until hunted down by a British squadron; the Austro-Hungarian fleet was bottled up in the Adriatic; the Turkish fleet was barred from the Aegean; the German naval base of Tsingtao and the German coaling stations in the Pacific were captured. In short, Sir John Jellicoe's * British fleet in the Atlantic (or possibly

in the North Sea) and the French fleet in the Mediterranean dominated the situation. The command of the seas so easily obtained was even more essential to Great Britain than it was injurious to Germany. Germany's merchant marine, for the time being, was swept from the seas. Great Britain captured 88 German merchant ships and detained 102; her allies captured 108; 54 (and 11 Austrian) lay in American ports, waiting until they could find purchasers or fly the American flag. The direct loss thus incurred by Germany must have been enormous; yet the indirect effects were even more grave, involving the partial inability of Germany to import food, copper, or munitions of war, or to market the products of her industry. But Germany could make her food supply last by strict economy; she had large supplies of most materials necessary for war, and the effectiveness of her army did not vitally depend upon control of the sea. For Great Britain, the loss of the seas would have spelled ruin. Her people would have been starved, her industries throttled, and her army prevented from engaging in the battles of France. The very fact that Germany is a large country combining agriculture and manufacture, surrounded by contiguous neutral countries, as contrasted with the insularity and almost complete industrialization of Great Britain, explains the secondary importance of naval power to Germany, and the primary importance of naval power to Great Britain.

The unexampled hatred which Great Britain had the misfortune to arouse in Germany was not altogether unconnected with British supremacy on the high seas. In the first place, the German manufacturer, the German workingman, and the German statesman alike resented the declaration by Great Britain of a "war on German trade" which threatened to deprive the manufacturer of his business, the workingman of his employment, and the statesman of his country's prosperity. In the second place, the control of the high seas by Great Britain made it very much more difficult for Germany to carry on the war successfully; it enabled Great Britain to scour the four quarters of the globe for military recruits, to bring black men from Africa, Asiatics from India, Malays, Canadians, and Australians, to fight against Germany in Europe; it made possible the future landing in France of a million British soldiers now being trained in England; it might entail bitter hardship on the German people through lack of sufficient food. In the third place, even should the German armies triumph, the British fleet would still stand between Germany and her dreams of world empire, for as long as the British fleet sailed the seas it would prevent Germany from becoming the greatest colonial and commercial Power, and would ensure to Great Britain the possession of the most valuable colonies in the world.

ESCAPE OF THE GOEBEN AND BRESLAU. At the outbreak of war one of Germany's most powerful and speedy battle cruisers, the *Goeben* (22,000 tons; 27.2 knots; 10 11-inch guns), and the light cruiser, *Breslau*, happened to be in the Mediter-

1882; served in China, 1898-1901; rear admiral, 1907; vice admiral and commander of the British Home Fleet, 1914. Sir John's position must not be confused with that of Sir JOHN ARBUTHNOT FISHER, first baron of Kilverstone (cr. 1909), and Admiral of the Fleet, who was born in 1841; entered navy, 1854; served in the Crimean War (1855), Chinese War (1859-60), and Egyptian War (1882); Lord of the Admiralty, 1892-97; First Sea Lord, 1904-10.

* VICE-ADMIRAL SIR JOHN JELlicoe, born in 1859; entered navy, 1872; won a medal in the Egyptian War,

anean, where they might conceivably be able to interfere with the transportation of French troops from Algeria to France, but were much more likely to fall in with superior French or British naval units. British and French warships immediately gave chase to the two German cruisers, which, however, were fortunate enough to elude pursuit and to make port first in Messina and then at Constantinople. There they were allowed to remain, until purchased by Turkey (see above). With Turkish names, they later figured in the bombardment of Russian Black Sea ports, and minor naval engagements.

EMDEN, KÖNIGSBERG, AND KARLSRUHE. Besides the *Goeben* and the *Breslau*, Germany had three fast cruisers and a Far East Squadron at large in the opening weeks of the war. The fate of the Far East Squadron is reserved for a subsequent section of this article; the story of the three cruisers, however, may well be told now. One of these, the *Emden*, commanded by the intrepid Capt. Karl von Müller, cruised the Indian Ocean and the South Pacific for three months, destroying 25 merchant vessels worth \$10,000,000 without their cargoes, firing the oil tanks at Madras, sinking 4 British steamers in Rangoon harbor alone, and stealing into the harbor of Penang disguised by the addition of a false fourth smokestack, to sink the Russian cruiser, *Jemtschung*, and the French torpedo boat, *Mousquet*. The *Emden* was not a powerful ship. Her displacement was only 3600 tons, her speed less than 27 knots, and her largest guns only 4.1 inches. Again and again more powerful warships were on the *Emden's* trail, but each time she escaped, until one day Captain Müller decided to destroy the wireless station at Cocos Islands southwest of Java. There the *Emden* was discovered by the Australian cruiser, *Sydney*, and driven ashore in flames, by the 6-inch guns of the *Sydney*, on November 9, after a sharp battle. The career of the second German cruiser, the *Königsberg*, had come to an end a few days earlier, when after destroying about a dozen merchantmen the cruiser was caught hiding in shoal water up the Rufiji River, opposite Mafia Island, in German East Africa. The *Karlsruhe*, the third German raider, had 16 prizes to her credit and, at the close of the year, was still at large in the region of the West Indies.

AUGUST EVENTS AND THE BATTLE OFF HELIGOLAND. In the first month of the war a series of minor events were recorded, before Beatty's dash into the bight of Heligoland. On August 5 the *Königin Luise*, a German liner which had been converted into a mine-layer, was torpedoed by the British destroyer, *Lance*. On the following day, the British cruiser *Amphion* struck a German mine and went down with 131 men. An example of excellent marksmanship was given by the *Birmingham*, which destroyed the German *U-15* on August 9. On August 27 the British cruiser *Highflyer* sank the North German Lloyd liner *Kaiser Wilhelm der Grosse*, which had been armed as a commerce destroyer. These British successes were crowned by the Heligoland action. Sir David Beatty,* a promising aspirant for naval fame, led a British fleet, accompanied by a flotilla of torpedo boat destroyers, into the bight of Heligoland and engaged part of the German

fleet almost under the guns of the German naval base. Three German armored cruisers and two destroyers were sunk in the battle on August 28, and 2500 German sailors were drowned.

BRITISH SEPTEMBER LOSSES. September brought disasters to the British. The armed steamer *Eyrion* and the gunboat *Speedy*, as well as the former White Star Liner *Oceanic*, were sunk by German mines. The British cruiser *Pegasus* and the French gunboat *Zelie* were destroyed by German cruisers in colonial ports. To offset these, the Germans had lost only the *Hela* and two converted cruisers. The climax was reached on September 22, when the German submarine *U-9*, having cruised several days out from the Kiel Canal, torpedoed three British cruisers within one hour, the *Aboukir*, the *Hogue*, and the *Cressy*. After making sure that all three ships were on their way to the bottom of the sea, Captain Weddigen turned the *U-9* homeward, and raced back to receive his Iron Cross from the Kaiser. On October 15 Captain Weddigen sank the British cruiser *Hawke*. On October 27 the British fleet sustained a still greater loss. The super-dreadnought *Audacious*, commissioned only two years previously, and ranking as one of the world's most formidable battleships, was sunk by mine or torpedo off the north coast of Ireland. Her crew, fortunately, were picked up by the liner *Olympic*, which happened to be near by. The British government, oddly enough, prevented the publication of news of this disaster, and allowed the British public to learn of it only after some time had elapsed, by reports and rumors from unofficial sources.

BATTLE OFF CHILE. All this time, the German Far East Squadron had eluded pursuit. On the evening of November 1 Admiral Cradock's* British squadron at last sighted the Germans off the coast of Chile (near Coronel). The German squadron of 5 cruisers was clearly more than a match for the 4 British ships. Against 8 8.2-inch guns on the German cruiser *Gneisenau* and 8 similar guns on the *Scharnhorst*, the British could avail themselves of only 2 9.2-inch guns on the *Good Hope* and a number of 6-inch guns. Altogether, the 3 British cruisers, *Good Hope*, *Monmouth*, and *Glasgow* (the armed transport *Otranto* hardly counted), mounted 2 9.2-inch guns, 34 6-inch guns, 10 4-inch guns, 21 12 pounders, and 10 3 pounders. The German cruisers *Gneisenau* and *Scharnhorst*, and the German light cruisers *Nürnberg*, *Leipzig*, and *Dresden* mounted 16 8.2-inch, 12 5.9-inch, 32 4.1-inch, 40 3.4-inch, and 12 2.1-inch guns. The Germans opened fire at 12,000 yards, with their 8-inch guns. The third salvo caused an outbreak of fire on the deck of the *Good Hope*, as also on the *Monmouth*. As the sun sank behind the horizon, and the heavy seas dashed against the bows of the British ships, the British gunners had increasing difficulty in training their guns on the German ships, and were unable to make any impression upon the up-to-date armor of the Germans. Fifty minutes after the first shot had been fired, the *Good Hope* blew up, shooting a column of fire 200 feet into the air. Shortly afterwards the *Monmouth* was dispatched. The *Glasgow* and the transport *Otranto* made off in time to escape destruction.

* DAVID BEATTY, born 1871; served in the Sudan and in China; rear-admiral, 1910; commander of the First Battle Cruiser Squadron, 1912.

* REAR ADMIRAL SIR CHRISTOPHER CRADOCK, born 1862; served in the Sudan and in China; promoted captain for gallantry at Taku; rear admiral since 1910.

BATTLE OFF THE FALKLAND ISLANDS. The British had their revenge a little more than a month later. On December 8 a powerful British squadron, which had been sent out under the command of Vice Admiral Sir Frederick Sturdee* to search for Admiral von Spee's five German cruisers, sighted the *Scharnhorst*, the *Gneisenau*, the *Nürnberg*, and the *Dresden* off the Falkland Islands. According to the laconic statement of the British admiralty, "an action followed, in the course of which the *Scharnhorst*, flying the flag of Admiral Count von Spee, the *Gneisenau*, and the *Leipzig* were sunk. The *Dresden* and the *Nürnberg* made off during the action and are being pursued. Two colliers also were captured. The Vice Admiral reports that the British casualties are very few in number. Some survivors have been rescued from the *Gneisenau* and the *Leipzig*."

COAST RAIDS. Perhaps the most surprising feature of the naval war was the inability of the British fleet, despite its boasted superiority over the Germans, to prevent German warships from raiding the British coast with impunity. The Germans made their first attempt on November 3. Three swift battle cruisers, the *Seydlitz*, the *Moltke*, and the *Von Der Tann*,—the armored cruiser *Blücher*, the slower armored cruiser *Yorck*, and the protected cruisers *Kolberg*, *Graudenz*, and *Strassburg*, started off at full speed on the evening of November 2, with decks cleared for action, and all lights out. At dawn they hove into sight of the English seaport of Yarmouth, 280 miles from Heligoland, whence, presumably, the Germans had started. After bombarding the towns of Yarmouth and Lowestoft for about 20 minutes, the raiding squadron returned as swiftly as it had come. A British submarine—the *D-5*—attempting to pursue the Germans, struck a mine and sank, with all but two of her crew. The German cruiser *Yorck* also encountered a mine, and was lost with 300 men. A second German raid was made on December 16, against the British coast towns of Hartlepool, Scarborough, and Whitby. The raiding squadron was probably the same as that of November 3. Hartlepool, the only one of the three towns which could be called a fortified town, was inadequately defended by the destroyers *Doom* and *Hardy* and a shore battery. The German cruisers poured a perfect hail of shells into the town for about an hour, and then made off. The town itself was considerably damaged, and over 300 persons were wounded, 113 fatally. Scarborough suffered less severely, losing only 17 killed (including 8 women and 4 children) and some 50 wounded. Whitby, the third town to be bombarded, reported many houses damaged, but only 3 persons killed and 2 wounded. This second raid called forth angry protests from the English press, on the ground that the bombardment of unfortified towns, and the killing of unsuspecting civilians, was a needless barbarity and could serve no military purpose. But apparently the German government considered it almost as important to strike terror into the heart of the civilian as the soldier. No other object could be discerned in the frequent attacks made by German aviators on cities like Paris, Antwerp, and Dover. Bombs dropped

from an aeroplane or from a Zeppelin might demolish an office-building or kill a few people, but they would hardly destroy fortifications. Germany's Zeppelins, by the way, were the subject of much speculation and grave anxiety in England, because many people feared that the huge airships might engage in systematic bomb-dropping, and possibly act in conjunction with the German fleet in a serious attack on the English coast.

VI. NEUTRAL NATIONS

ITALY. Italy, bound by the terms of the Triple Alliance to assist Germany and Austria-Hungary in case they should be attacked by other nations, would naturally have been expected to join with her allies in the war. When Germany, being "attacked" by France and Great Britain, called upon Italy for aid, Italy refused, on the ground that Germany and Austria-Hungary were engaged in an aggressive rather than a defensive war. While refusing to join Germany, Italy showed at first no disposition to espouse the cause of Germany's enemies. Grave industrial disorders, the unpreparedness of her army, and the uncertainty of the outcome, were a few of the factors making for Italian neutrality. Perhaps also the death of Pope Pius X may have strengthened the sentiment in favor of peace. (See ROMAN CATHOLIC CHURCH.) As the war progressed, however, and Germany failed to crush her antagonists, an ever-increasing current of popular opinion urged Italy to make common cause with Great Britain, France, and Russia, to attack her former allies, and to wrest from Austria-Hungary the "unredeemed" Italian districts of Trentino and Trieste. In December the distinguished German ex-Chancellor, Von Bülow, was sent to Rome, presumably charged with the delicate mission of making such diplomatic representations as would gain Italy's support for Germany, or at least prevent Italy from joining the Allies. In the same month, Premier Salandra, in a warmly chauvinistic speech, declared that at the proper moment, Italy would take energetic action to secure her national interests and aggrandizement. See ITALY, *History*; also ALBANIA.

UNITED STATES. At the outbreak of war, the ambassadors of the United States were generally called upon to take over the functions of the ambassadors whose nations were at war. Thousands of tourists, stranded in Europe, besieged the American embassies in hope of obtaining emergency passports and cash for their return home—for the whole system of international credit seemed to have collapsed. While the stream of panic-stricken tourists was flowing westward across the Atlantic, another stream flowed back to Europe, made up of reservists of all nationalities. As one of the two Great Powers remaining neutral, the United States was in a position to offer its good offices, according to Article III of The Hague Convention, in the hope that even at the last moment the nations might reconcile their differences; President Wilson's offer of mediation, August 5, was courteously acknowledged, but not accepted. On September 8 the President set aside October 4 as a day of prayer for peace; but he did not renew his diplomatic efforts, as the hopelessness of mediation was only too obvious. Officially and unofficially the various belligerents appealed to public opinion in the United States to approve

* FREDERICK CHARLES DOVETON STURDEE, born 1859; entered navy, 1871; served in Egyptian War, 1882; captain, 1899; commander of the Second Cruiser Squadron, 1912.

their actions. Not only were the "White Books" and "Yellow Books," and "Gray Books" widely circulated, but personal appeals were made to President Wilson by a Belgian delegation, which protested against German outrages; by the Kaiser, who denounced the Belgians; by President Poincaré, who denied that the French were using dum-dum bullets. The presence in America of a large number of German-Americans, whose sympathies were strongly enlisted on the side of Germany, tended to produce an acute conflict of popular sentiment, for the non-German population was generally favorable to the Allies. In the press and on the platform the merits of the case were argued. President Wilson's proclamation of August 18, urging all citizens to refrain from violent expressions of sympathy in public, whether for or against Germany, moderated but did not end the debate. The war also exercised a profound influence upon the economic life of the nation. On July 31, the day Russia mobilized, the New York Stock Exchange closed its doors for the first time since 1873. In spite of the financial stringency, J. P. Morgan and Company were prepared to loan \$100,000,000 to France, but desisted, in deference to the announcement by Secretary Bryan that the administration would not view with favor the extension of loans to the belligerent nations. After the first few days of war, the financial condition of the country rapidly recovered, although the cotton growers of the South found themselves unable to market their product, and although new taxes—"war taxes"—were necessitated by the falling off of the customs revenue. War orders for millions of army blankets, for motor trucks, for steel, and for countless other commodities helped to improve the situation. The question of American shipping is treated in the article on the UNITED STATES.

OTHER NEUTRAL NATIONS. The general effect of the war upon neutral nations was, at first, to cause a financial stringency, which was usually met by a moratorium, and, later, to impose additional burdens upon the tax-payers, by reason of the decline of customs revenues, and in some countries, the necessity of extraordinary military expenditure. The Netherlands, for instance, being situated on the northern boundary of Belgium, was compelled to introduce a régime of martial law, to establish patrols on her frontiers, and to mine the mouth of the Scheldt, in order to preserve her neutrality. Portugal was not really neutral, as her treaty of alliance with Great Britain bound her to furnish a contingent of troops to aid Great Britain if necessary; the Portuguese government repeatedly affirmed its intention to fulfill this treaty obligation, but no reliable information could be obtained regarding the military measures actually taken. Rumania, especially after the death of King Charles, October 10, was strongly inclined to abandon her neutrality, and to conquer the Rumanian regions of Bukovina and Transylvania from Austria-Hungary. Rumania, however, remained neutral, as did Greece and Bulgaria. The latter State, being under financial obligations to Germany, was looked upon as a possible ally of Austria-Hungary, Germany, and Turkey. Spain, it was rumored, refused to listen to a German suggestion that by making war upon France all Morocco could be gained. Sweden, intent upon preserving her neutrality, conferred with Denmark and Norway at the important

Malmö Conference, December 18-19 (see SWEDEN). Switzerland was forced to mobilize her army to make sure that neither German nor French armies should violate Swiss territory. Two South American nations—Ecuador and Colombia—were complained against by Great Britain in November, as it was alleged that wireless stations on their soil were flashing information to the German fleet of Admiral von Spee. Both States denied the charges; but later reports pointed to the discovery of German wireless stations at Cartagena (Colombia) and at Callao (Peru). Argentina on December 22 protested against the British use of the Falkland Islands near her coast for naval purposes. Venezuela at the very end of the year put forward a proposal for a conference of neutral nations at Washington to discuss the rights of neutral Powers. In Asia, the neutral nation of China again furnished, as it had in 1904-05, the theatre of military operations for Japanese troops. The Japanese landing party which besieged Kiaochow did not hesitate to trespass on Chinese territory outside of the German concession, despite China's protests. For further information regarding neutral nations, see articles on CHINA, GREECE, RUMANIA, etc.

For detailed information respecting the internal affairs, the military establishment, and the naval strength, of the belligerent Powers, consult articles on FRANCE, GERMANY, GREAT BRITAIN, RUSSIA, etc., under sections *History*, *Army*, and *Navy*; see also article on MILITARY PROGRESS. For maps see AUSTRIA-HUNGARY, BELGIUM, FRANCE, GERMANY, and RUSSIA. The pacifist endeavors of the Pope are discussed in the article ROMAN CATHOLIC CHURCH. The attitude of the Socialists toward the war is treated under SOCIALISM. See also FRENCH LITERATURE, *During the War*; GERMAN LITERATURE; INTERNATIONAL ARBITRATION AND PEACE, *passim*; LITERATURE, ENGLISH AND AMERICAN, *War Literature*, and *Poetry*; and RELIEF FOR WAR VICTIMS.

WAR REVENUE BILL. See UNITED STATES, sections *Congress* and *Financial Revenue*.

WARSAW, GERMAN ADVANCES ON AND RETREATS FROM. See WAR OF THE NATIONS.

WASHBURN, FRANCIS. An American clergyman and writer, died Dec. 5, 1914. He was born in New York, in 1843, and was privately educated. In 1874 he was licensed priest, and for four years served as secretary of the New York District Conference of the Methodist Episcopal Church. Shortly after, he began to study for orders in the Protestant Episcopal Church and was ordained priest in 1880, serving as rector in several parishes in New York State until 1892, when he retired from active church work. He was a prolific writer, and among his published works are: *Soul Thirst* (1879); *Thoughts on the Lord's Prayer* (1883); *Meditations on Charity* (1887); and *Imperilled Faith* (1899). He also contributed verse and prose to religious and secular journals.

WASHINGTON. POPULATION. The estimated population on July 1, 1914, was 1,407,865. The population in 1910 was 1,141,990.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. bu.	Value
Corn	1914	36,000	972,000	\$710,000
	1913	34,000	952,000	762,000
Wheat	1914	1,780,000	41,840,000	41,840,000
	1913	2,300,000	53,300,000	38,909,000
Oats	1914	297,000	13,959,000	5,863,000
	1913	300,000	14,250,000	5,700,000
Barley	1914	182,000	7,098,000	3,691,000
	1913	180,000	7,290,000	3,791,000
Potatoes	1914	59,000	7,552,000	4,154,000
	1913	60,000	7,380,000	4,428,000
Hay	1914	796,000	1,751,000	19,261,000
	1913	780,000	1,794,000	19,555,000

a Tons.

MINERAL PRODUCTION. The total value of the metal mine output of Washington in 1913 was slightly more than \$1,000,000, a decrease of 6 per cent from the value of 1912. This was due in part to the decreases in the silver and copper production, and in part to the somewhat lower metal prices. There was an increase of 2 per cent in the gold output, valued at \$694,000. There was a decrease in the silver yield of about 21 per cent, from 413,538 ounces in 1912, to about 326,000 ounces in 1913. The silver output was evenly divided between the siliceous ores and copper ore. The copper output decreased about 9 per cent, from 1,086,010 pounds in 1912, to about 976,000 pounds in 1913. No zinc ore was shipped from the State in 1913, but there were shipments of lead ore from Stevens County to the amount of nearly 300,000 pounds, as compared with 127,387 in 1912. The total value of gold, silver, copper, and lead mines in 1913 was 3,877,891 short tons, valued at \$9,243,137, a substantial increase over the output of 1912, amounting to 516,959 short tons. The quantity of coal made into coke increased from 76,741 tons in 1912, to 118,698 tons in 1913. There were 5794 coal miners in the State in 1913. The production of coal in 1914, according to the estimates of the United States Geological Survey, was between 20 and 30 per cent less than in 1913. This was due chiefly to the increased use of fuel oil in manufactures and by railroads. The total value of the mineral products of the State increased from \$15,347,313 in 1912, to \$17,579,743 in 1913.

The value of the mine output of gold, silver, copper, and lead in the State in 1914 was less than \$800,000, a decrease of over 24 per cent. Gold decreased from \$696,275 in 1913, to \$558,000 in 1914, or nearly 20 per cent. The silver output decreased from 331,239 ounces in 1913, to 253,000 ounces in 1914, or over 23 per cent. The copper output decreased from 954,081 pounds in 1913, to 737,500 pounds in 1914.

TRANSPORTATION. The total railway mileage of the State on June 30, 1913, was 8830. The railroads having the longest mileage are the Northern Pacific, 2738; the Great Northern, 1391; the Oregon-Washington Railroad and Navigation Company, 1199; Chicago, Milwaukee, and St. Paul, 807; Spokane, Portland, and Seattle, 548.

EDUCATION. The total school population in 1914 was 296,695. There were enrolled in the public schools 238,663, the average daily attendance being 180,225. There were 6928 female, and 1711 male teachers, and the average monthly salary of male teachers was \$105, and of female teachers \$83.

FINANCE. The report of the State Treasurer for the biennial period, 1912-14, shows a balance on hand on Oct. 1, 1912, of \$149,266. The

total receipts for the year were \$7,215,698, and the disbursements for the same period amounted to \$6,614,308, leaving the cash on hand on Sept. 30, 1914, \$750,656. The funded debt of the State on Sept. 30, 1912, consisted of \$125,000 of State highway bonds, and \$206,024 of normal school series bonds. The per capita debt was \$1.21.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State, under the supervision of the State Board of Control, are as follows: State School for the Deaf, and State School for the Blind, at Vancouver; State Training School, at Chehalis; State Soldiers' Home, at Orting; Washington Veterans' Home, at Port Orchard; Western Hospital for the Insane, at Fort Steilacoom; Eastern Hospital for the Insane, at Medical Lake; Northern Hospital for the Insane, at Sedro Wooley; State Penitentiary, at Walla Walla; State Institution for Feeble-Minded, at Medical Lake; and State Reformatories, at Seattle, Tacoma, Olympia, Everett, and Monroe.

POLITICS AND GOVERNMENT. The State Legislature had no meeting in 1914, as the sessions are biennial, and the last was held in 1913. Elections were held for United States Senator, and for representatives in Congress. Senator Jones, whose term expired in 1915, was a candidate for reelection, and was opposed by Democratic, Progressive, Socialist, and Prohibition candidates. In the election of November 3, Senator Jones received 130,479 votes; Black, Democrat, 91,733; Hanson, Progressive, 83,282; and Barth, Socialist, 30,234, the total number of votes cast being 345,279, compared with 322,799 at the presidential election of 1912. The Republicans showed an increase of about 60,000 votes, the Democrats an increase of about 5000, the Progressives a loss of about 30,000, and the Socialists a loss of about 10,000. Republicans were elected in all five Congressional districts. At an election in Seattle, on March 3, Hiram C. Gill, once recalled as mayor of that city, was again chosen mayor in a nonpartisan election. A measure providing for State-wide prohibition was carried at the election in November.

STATE GOVERNMENT, 1915. Governor, Ernest Lister; Lieutenant-Governor, Louis F. Hart; Secretary of State, I. M. Howell; Treasurer, Edward Meath; Auditor, C. W. Clausen; Superintendent of Education, ———; Attorney-General, W. V. Tanner—all Republicans except Governor, who is a Democrat.

JUDICIARY. Supreme Court: Chief Justice, H. D. Crow; Associate Justices, O. G. Ellis, M. A. Fullerton, W. Mount, M. F. Gose, S. J. Chadwick, George E. Morris, Emmett N. Parker, and J. F. Main—all Republicans except Chadwick and Ellis; Clerk, C. S. Reinhart.

STATE LEGISLATURE, 1915.

	Senate	House	Joint Ballot
Republicans	28	77	105
Democrats	6	13	19
Progressives	7	7	14
Republican majority	15	57	72

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WASHINGTON, UNIVERSITY OF. A State institution for higher education, founded at Seattle, Wash., in 1861. The students enrolled in the several departments in the autumn of 1914 numbered 2888; of these, 1315 were in the

College of Liberal Arts, 425 in the College of Science, 472 in the College of Engineering, 185 in the School of Law, and 148 in the Graduate School, the remainder being in the Schools of Forestry, Mines, Pharmacy, Fine Arts, and Education. The faculty numbered 194. During the year William Franklin Allison was appointed professor of highway and municipal engineering, to fill the place made vacant by the resignation of Prof. C. E. McCaustland. The university is supported by appropriations from the State, and the appropriation from 1913 to 1915 amounted to \$1,001,200, or \$500,600 per year. The library contains 64,000 volumes. The acting president is Henry Landes.

WASHINGTON AND LEE UNIVERSITY.

A university for higher education, founded at Lexington, Va., in 1749. The total enrollment in the autumn of 1914 was 492, of whom 346 were in the academic and scientific department, and 146 in the law department. The faculty numbered 26. During the year Dr. Franklin L. Riley, of the University of Mississippi, became professor of history, filling the vacancy caused by the election of Dr. J. H. Latane to the professorship of American history at Johns Hopkins University; Dr. Edgar E. Shannon, professor of English and dean at the University of Arkansas, succeeded Dr. W. S. Currell as professor of English, Dr. Currell resigning to accept the presidency of the University of South Carolina; Mr. William H. Moreland became professor of English, succeeding Mr. M. P. Burks, who was appointed on a committee to revise the Virginia code of laws; and Dr. H. B. Schermerhorn was elected professor of law to fill the vacancy caused by the death of Prof. Abram P. Staples. No noteworthy benefactions were received during the year. The productive funds of the university amounted, on April 30, 1914, to \$878,049. The annual income is \$101,271. The library contains approximately 50,000 volumes. The president is Henry Louis Smith, Ph.D.

WASHINGTON UNIVERSITY. An institution for higher education, founded in 1853, at St. Louis, Mo. The students enrolled in all departments of the university in the autumn of 1914 were 1390, and the faculty numbered 206. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds amounted to \$6,156,223, and the total income to \$479,791. The library contained 142,589 bound volumes, and 80,000 pamphlets. The president of the university is David S. Houston.

WATER POWER. See **ELECTRIC POWER, TRANSMISSION OF.**

WATER PURIFICATION. The rapid growth of water purification plants in number and size during the previous 5 or 10 years, and good promise of later growth bid fair to put the United States on a par with Great Britain and Germany, where the use of surface waters without treatment was unusual. Most of the newer American filter plants were of the mechanical or rapid, instead of the slow sand type. Chlorine disinfection of all surface waters suspected of being polluted with sewage was becoming the rule, even where the water was filtered. Liquid chlorine (compressed chlorine gas) was displacing hypochlorite of lime (calcium chloride or bleaching powder). The liquid chlorine is far less bulky, is easier to handle, the dosing apparatus is far more compact, and automatic

regulation of the supply is more readily secured. Water softening plants, which, until recently, were few and far between in the United States, although common enough in Europe, were being installed by a number of American cities, the most notable example being Cleveland, Ohio, which was building a 150,000,000-gallon large water softening and filtration plant. Large water purification plants were also being built in 1914 by Baltimore and St. Louis, and a contract was awarded by Toronto, Ont., for a "drifting sand" type of mechanical filter, but recently introduced in England, and not yet tried practically by an American city.

Unique studies to determine the best means of removing iron and manganese from underground waters had been made, and plants installed for several Massachusetts cities. In the latter part of 1914, contracts for such a plant were let by Lowell, Mass. The plant was to have a nominal capacity of 100,000,000 gallons a day. The water was first to be passed through 6 coke prefilters, 10 feet deep, with a total area of 0.4 acre, operated as control beds. It would then go to a 500,000-gallon settling basin, in 2 units, and next to 6 sand filters having a total area of 1 acre. The filtered water would pass to a 1,000,000-gallon reservoir. The estimated cost of treating the water by this method was \$7.65 per 1,000,000 gallons, including capital charges. A few iron-removal plants have been in use in America for a decade or two, but it is only recently that manganese has been recognized as a source of trouble in well waters.

A board of sanitary experts, appointed by the International Joint Commission (see **SEWAGE PURIFICATION**), reported during the year a tentative standard of permissible sewage-pollution burden on water-purification plants located on the Great Lakes. The safe burden would be exceeded if the average number of B. Coli in the water delivered to a filtration plant during a year exceeds 500 per cubic centimeter, or if B. Coli is found 50 per cent of the time in 0.1 cubic centimeter samples. Extended discussions of water purification appeared during the year in the *Journal of the American Water Works Association* (New York). Water purification is considered in Rideal's *Water Supplies* (London and New York).

WATER STERILIZATION. See **CHEMISTRY, INDUSTRIAL.**

WATER-SUPPLY. See **AQUEDUCTS.**

WATER-WORKS. Besides work on the Catskill Aqueduct for the additional water-supply of New York City, which was nearing completion, work supplementary to the Los Angeles Aqueduct, a lengthy supply line for Winnipeg, Manitoba, new water-works intake tunnels at Chicago, Cleveland, Milwaukee, and St. Louis, and numerous large water purification plants, much smaller work was going on all over the United States and Canada. Bids were being asked at the close of the year for water-supply and sewerage concessions for Athens, and the Piræus, Greece. A large and unique water-works system was under construction in southeastern Italy with 10,000 men employed since October, 1906. Some 3,000,000 people in the cities and towns of the provinces of Foggia, Bari, and Lecce, comprising the former Duchy of Apulia or Puglia, were to be supplied from springs at the source of the river Sele through an aqueduct with a capacity of 150,000,000 gal-

lons a day, and a network of cast-iron pipe. The aqueduct will be 60 miles long, mostly in tunnel, and the aqueduct and pipes together will have a length of 1900 miles. About 400 Venturi meters will control the supply to the various branch lines, and the supply to each private consumer will also be metered. The head of the aqueduct will be used to develop water power and hydroelectric power to pump water to many towns and cities located 200 to 700 feet above the main conduit, and where such power is not available, Diesel oil engines will be used. The works were being built by the Società anonima Italiana Concessionaria dell' Acquedotto Pugliese-Genova, which will receive 124,000,000 lire (\$24,800,000) from the Italian government. The project was to cost much more than that, but the company was to have the entire earnings from the works for 90 years after their construction. See also **AQUEDUCTS, MUNICIPAL OWNERSHIP, WATER PURIFICATION.**

WATSON, EUGENE WINSLOW. A rear admiral (retired) of the United States Navy, died Dec. 12, 1914. He was born in Northampton, Mass., in 1843, and was educated in Philadelphia. He joined the navy as master's mate in 1859 and during the Civil War saw service on several vessels. He is said to have been the last surviving officer who saw the *Monitor* sinking in a gale off Hatteras nine months after her famous engagement with the *Merrimac*. After the war he was commissioned an ensign in the regular navy and was promoted through various grades to be captain in 1899. At the beginning of the war with Spain he was commandant of the naval station at New London and was then placed in command of the *Scindia*. In 1902, being at that time in charge of the navy yard at Norfolk, Va., he was retired at his own request.

WEATHER BUREAU. See **METEOROLOGY.**
WEIGHTS AND MEASURES. In the republic of China the metric system, through the presidential decree of March 31, 1914, made a slight advance over the conditions established by the law of July 29, 1908. The first article of this decree provided that the standards of weights and measures would be based on the international meter and kilogram of the International Bureau; the second article provided that weights and measures should be classed in two categories. First, a system based on the foot of the Public Works Service, and the taël of the balance of the treasury. The foot of the Public Works Service was defined as $\frac{32}{100}$ of the meter standard measured between 0 and 100, at the temperature of 0 degrees on the Centigrade thermometer; while the taël of the Bank of the Treasury was equal to $\frac{37,801}{400,000}$ of the weight of the kilogram standard. Second, the International System of Weights and Measures in common use was also adopted, where the unit of length is the meter, and the unit of weight is the kilogram, the meter representing the entire length of the metrical standard between 0 and 100 at a temperature of 0 degrees on the Centigrade thermometer, and the kilogram representing the weight of the standard kilogram.

In the United States considerable progress was made towards securing greater accuracy and harmony of weights and measures, and weighing methods. Various State Legislatures had the matter under advisement, and the different bureaus and officials prosecuted their in-

vestigations and enforced their laws in many cases effectively. The success of the special track inspection car of the United States Bureau of Standards led to a decision to duplicate it, and plans were prepared for a second car during the year, and others were to be added in the future. Track scale inspection as carried on by the United States government found a number of inaccurate scales, and the standard of scales was being constantly raised by railway companies and the scale-makers. See articles on "Railway Track and Weighing Methods" in *Engineering Magazine* (New York), May and June, 1914.

During the year there was installed in the basement of the city hall in Chicago a 100-foot heavy standard, presented to the city by the Western Society of Engineers. This bar is $2 \times \frac{1}{2}$ inches in cross section, 102 feet in length, and was made in 6 pieces, which were welded together in place by the oxy-hydrogen flame. It rests on rollers, secured to brackets 42 inches apart, which are so attached to the wall as to permit the bar being adjusted to a vertical plane. The bar is to be used for the standardizing of tapes and other measures of length, and after it was set and leveled, small plates of an alloy of 90 per cent platinum, and 10 per cent iridium, $\frac{5}{8}$ of an inch in diameter, were inserted, flush with its top surface at each point where a graduation mark was to be placed: at 0, 1 foot, 1 yard, 1 meter, 10 feet, 25 feet, 50 feet, 66 feet, 20 meters, 30 meters, and 100 feet. At the 0 end of the rod there was provided a clamp for holding the end of a tape line to be tested, and at the opposite end a spring press. The rod was graduated in October, 1913, by L. A. Fischer, Chief of the Division of Weights and Measures of the United States Bureau of Standards, and was officially accepted by an ordinance of the City Council of Chicago on March 20, 1914.

There was before Congress, in 1914, a bill requiring a standard barrel for fruit, vegetables, and other dry commodities, and providing the following dimensions for such a barrel: a length of stave, $28\frac{1}{2}$ inches, diameter of heads $17\frac{1}{8}$ inches, distance between heads 26 inches, circumference of barrel, 64 inches. Any barrel of different form having a capacity of 7056 cubic inches was to be termed a standard barrel, while a special barrel of other dimensions was made standard for cranberries. This bill was discussed and opposed by the advocates of State's rights on the ground that individual States should describe their own standard barrel.

WEIHAIWEI. A British leasehold on the north coast of the Shantung Peninsula, leased by China to Great Britain, July 1, 1898. The leased area includes the island of Liukung, all the islands in the bay of Weihaiwei, and a strip of mainland 10 miles wide along the entire coast of the bay. Total area, 285 square miles; population 1911, 147,177. The Commissioner (Sir J. H. Stewart Lockhart, in 1914) resides at Port Edward.

WELFARE WORK. See **SOCIAL ECONOMICS** and **SOCIAL INSURANCE.**

WELLESLEY COLLEGE. An institution for the higher education of women, founded in 1875, at Wellesley, Mass. The total number of students in all departments in 1914 was 1452, and there were 140 members in the fac-

ulty. There were no notable changes in the faculty during the year. The amount received in gifts and bequests amounted to \$172,257. The productive funds amounted to \$2,056,226, and the annual income from funds to \$69,548. The library contains 80,000 volumes. On May 12, 1914, the main building of the college was destroyed by fire, and a campaign was carried on during the year for the collection of funds to erect a new building. The dean of the college is Ellen F. Pendleton.

WELSH, CHARLES. An American author and literary critic, died Sept. 12, 1914. He was born at Ramsgate, Kent, England, in 1850, and was educated in the national schools at Ashford, Kent, afterwards studying at the Society of Arts and at the Mechanics' Institute. In 1868 he became a reporter on a trade journal in London and was employed in various capacities with publishing houses and newspapers in that city until 1895, when he removed to the United States and became business manager and assistant editor of *The Art Amateur*. He was an authority on domestic science and juvenile literature, and gave lectures and readings on that and other literary subjects. From 1909 to 1912 he was principal of the School of Domestic Science for the International Correspondence Schools, and from 1912 until his death was editor for the World Book Company. His published works include: *Publishing a Book* (1900); *Automobilia* (1905); *Love's Garland* (1905). He compiled and edited many works including several series for young people. These include: *The Uncle Charlie Series of Pleasure Books for the Young*, and *The Young Folks Library* (with T. B. Aldrich, 20 vols., 1901); *The Right Reading for Children* (1902); *Heath's Home and School Classics* (50 vols., 1900-03). He also edited: *Irish Literature* (with Justin McCarthy, 10 vols., 1904); *The Golden Treasury of Irish Songs and Lyrics* (1907); *The Works of Henry W. Longfellow* (1909); *The World's Great Books, Great Plays, and Great Men and Women* (1911); *Stories of Adventure Children Love* (1912); *Stories of Americans Children Love* (1913). He contributed to many magazines on history and literature for children, and other literary and educational topics.

WEMYSS, FRANCIS CHARTERIS, tenth EARL OF. An English nobleman, died June 30, 1914. He was born in 1818 and succeeded his father to the title in 1883. He was educated at Eton and at Christ Church, Cambridge. From 1841 to 1883, as Lord Elcho, he was a member of Parliament, and from 1852 to 1855 he was Lord of the Treasury. He published *The New War Office* in 1899.

WERNZ, FRANCIS XAVIER, twenty-ninth General of the Society of Jesus, died Aug. 20, 1914. Born Dec. 4, 1842, at Rottweil, Württemberg, Germany, he entered the Jesuit order the day after he completed his fifteenth year. He made the usual course of study of the Society and was ordained priest in 1871. Soon after, the Jesuits were banished by Bismarck from Germany. Wernz was sent to England where from 1876 to 1883 he taught science and canon law at Ditton Hall near Liverpool and at St. Beuno's College, North-Wales. In 1883 he was appointed to the chair of canon law in Gregorian University, Rome, and on Sept. 8, 1904, became the rector of that institution. His five volumes explaining and illustrating the law of the Church are re-

garded as the standards on the study of canon law and second only to the great treatises of Benedict XIV. At the General Congregation of the Society in September, 1906, to elect a successor to the deceased General Father Martin, he was one of the three delegates from Germany, and on September 8th was elected on the third ballot to the vacant generalship. He was a methodical organizer and during his term of office promoted the New Orleans, California, and Canadian "Missions" of the Society to the dignity of "Provinces," making five in all for the North American continent. He was an important figure in Rome, where he resided at the German College, being a member or consultant of a number of the curial congregations and commissions. As the rule of the Society requires, his official testament designated as his successor to govern the Society until the election of the new general, the Rev. Edmund Fine, the French "Assistant" to the General.

WESLEYAN METHODIST CONNECTION OF AMERICA. This denomination was founded in 1843 as a protest against the institution of slavery. To this communion soon came a great number of persons from the Methodist Episcopal and other churches, who were dissatisfied with the attitude of their respective churches upon this question. General dissatisfaction with the Episcopal form of government led, in the organization of the new church, to the adoption of a constitution based somewhat upon that of the Federal government, so that it was often called in the early years of its history, the Congregational Methodist Church.

After the close of the war many, who felt that the purpose for which the new church had been organized had been accomplished, reunited with the larger churches, but a considerable body adhered to the new organization, which became the nucleus of an aggressive reform body which has been successfully maintained to the present time. Separation from all worldly and sinful alliances on the part of Christian people, and the advocacy of the Wesleyan doctrines of justification and holiness as essential to salvation, occupy a prominent place in the thought and work of the church, as well as work for the adoption of other needed reforms, such as the prohibition of the liquor traffic.

Evangelistic work in America and missionary work in India and Africa are successfully prosecuted, with the result that the membership is steadily increasing. In 1914 there were about 20,000 members, and 840 ministers. Sunday School work is receiving increased attention and the number of schools has materially increased during the past few years.

Three schools of college grade are maintained—at Houghton, N. Y., Miltonvale, Kan., and Central, S. C. Besides these there is maintained a successful theological school at Fairmount, Ind., and a very flourishing school for colored people in Alabama. The next meeting of the General Conference of the denomination will be held in June of 1915, in Houghton, New York.

WESLEYAN UNIVERSITY. An institution for higher education, founded at Middletown, Conn., in 1831. The number of students in the autumn of 1914 was 460, and the faculty numbered 42. During the year Frederick Slocum, Ph.D., was elected professor of astronomy. The college is building a new observatory,

largely the gift of the late Professor John Monroe Van Vleck, a former member of the faculty, for whom the building is to be named. The productive funds at the end of the collegiate year amounted to \$2,167,194, and the income to \$168,649. The library contains about 100,000 volumes. The president is William K. Shanklin, D.D.

WEST, WILLIAM STANLEY. An American public official, former United States Senator from Georgia, died Dec. 22, 1914. He was born in Marion Co., Ga., in 1849, graduated from Mercer University in 1880, and after studying law began practice at Valdosta in 1883. He was also a planter, and president and general manager of the Valdosta Street Railway Company. From 1892 to 1901 he was a member of the Georgia House of Representatives, in the four years succeeding was a member of the State Senate, and in 1906 he was elected delegate-at-large to the Democratic National Convention at Denver. He was appointed in March, 1914, to fill the vacancy in the United States Senate caused by the death of Augustus O. Bacon (q.v.), which term expired in November, 1914. Senator West was chairman of the Board of the Southern Georgia State Normal College and a trustee of the University of Georgia.

WESTERN AUSTRALIA. A State of the commonwealth of Australia. It is the largest of the states, having an estimated area of 975,920 square miles. The census of April 3, 1911, returned a population of 282,114, exclusive of full-blooded aboriginals; estimate of Dec. 31, 1912, 306,129. The capital is Perth, whose population, with suburbs, in 1911, was 106,792. The Governor, in 1914, was Maj.-Gen. Sir Harry Barron (from March, 1913). Premier, John Scadden. See AUSTRALIA.

The elections which were held in May, 1914, to replace one-third of the Legislative Council, resulted in the loss of 1 seat by the Labor party and the acquisition of 2 by the Country party. A short and unimportant session of the Parliament was terminated on July 1, preparatory to the general elections which were called for October 21. In defending the policies pursued by the government of which he is a member, Mr. Thomas Walker (attorney-general and minister of education) declared: "I believe we are really in advance of any State in providing homes for workers by easy methods. The chief criticism against our government is leveled at the State steamships, but there is no difference in principle between a line of iron and a line on the ocean. We have succeeded in attaining some of the objects for which this line of ships was established, but I am free to confess that one of the ships was not a good bargain. . . . The State butcher's shop has paid from the beginning, and our three or four State hotels are flourishing. . . . The State sawmills have started operations. . . . The State brick-kilns are on their way, while our State dairying enterprise, from which we distribute the milk, has been responsible for saving the lives of many of the infants in the children's hospitals."

WESTERN RESERVE UNIVERSITY. An institution for higher education, founded at Cleveland, Ohio, in 1826. The total enrollment in all departments in the autumn of 1914 was about 1300, and the faculty numbered 234. There were no notable changes in the faculty

during the year. During 1914 was completed the payment of subscriptions of an additional \$1,000,000 endowment for the funds of the School of Medicine. The productive funds of the university amount to about \$5,212,000, and the annual income to about \$260,000. The Flora Stone Mather House, a dormitory for women, to cost \$80,000, was under construction in 1914. The library contains about 110,000 volumes. The president is Charles E. Thwing, D.D.

WESTINGHOUSE, GEORGE. An American inventor and financier, died March 14, 1914. He was born at Central Bridge, Schoharie Co., N. Y., in 1846, and was educated in common and high schools, and at Union College which he attended for three years. His father, also named George, was the inventor and maker of farming implements. At the age of 17 young George Westinghouse joined the Twenty-sixth United States Cavalry, but his taste for engineering led to his transfer to the navy, where he was attached to the Potomac flotilla with which he acted as third assistant engineer until the end of the war.

Then returning to his father's shop in Schenectady, he soon invented a device for rerailing steam cars. He next became interested in the invention of a brake for railways cars, first trying steam but without success; then chancing to read of air power, he experimented with that means for applying his brake. While working on this invention he quarreled with two men who were working with him and removed to Pittsburgh. The device which he invented was patented when Westinghouse was 21 years old. At first he had difficulty in impressing railroad officers with the value of this invention, but its use became general and its adoption is now made compulsory in the United States by act of Congress. After the perfection of the air-brake, Mr. Westinghouse turned his attention to the development of a device for transporting natural gas, and although his efforts were ridiculed by engineers, they were finally successful. He became interested in the alternating electric current and found that by its use power could be transmitted to a much greater distance than with the ordinary current. The value of this discovery was proved at the World's Fair in Chicago, where he obtained the electric lighting contract at a price \$1,000,000 lower than any other bidder. Mr. Westinghouse afterwards became interested in the development of electrical machinery of various sorts and made many electrical inventions. He furnished funds to Nicola Tesla, which enabled the latter to develop the induction motor which made possible the utilization of alternating current for power purposes. He built the first 10 great dynamos for the great hydroelectric plants at Niagara Falls, and also the dynamos for the elevated and subway railways in New York, and for the Metropolitan Railway in London. He took a foremost part in developing gas engines, and in adapting steam turbines to electric generation. Mr. Westinghouse possessed not only the gift of developing inventions that were essential to the prosperity of the country, but he had also the faculty of organizing companies, gathering about him men of ability, and obtaining their loyal services. He established works at Wilmerding, Pittsburgh, Swissvale, and Trafford City, Pa.; Hamilton, Canada; Manchester and

London, England; Havre, France; Hanover, Germany; St. Petersburg, Russia; Vienna, Austria; and Vado, Italy. These industries represent an investment of more than \$200,000,000, and give employment to 50,000 men. Mr. Westinghouse was a tireless worker and he had in connection with his Pittsburgh plant, a private laboratory where much of his time was spent and where he kept 40 or 50 men at research work. After the panic of 1907 the Westinghouse Electric and Manufacturing Company, the name under which his industries were conducted, went into the hands of receivers, but Mr. Westinghouse fought for the reorganization of the company on his own plan and was successful. During the last years of his life he withdrew gradually from the various companies and placed greater responsibilities on his associates.

Experts in the industrial development of the United States have placed Mr. Westinghouse among the seven or eight men to whom credit must be given for the commercial advance of the country. Lord Kelvin said of him: "George Westinghouse is, in character and achievement, one of the great men of our time." He was decorated with the Legion of Honor of France, and received decorations also from the King of Italy and the King of Belgium.

WEST VIRGINIA. POPULATION. The estimated population on July 1, 1914, was 1,332,910. The population, in 1910, was 1,221,119.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

	<i>Acres</i>	<i>Prod. bu.</i>	<i>Value</i>
Corn	1914 732,000	22,692,000	\$18,834,000
	1913 732,000	22,692,000	18,154,000
Wheat	1914 236,000	3,540,000	3,823,000
	1913 235,000	3,055,000	3,055,000
Oats	1914 105,000	2,100,000	1,155,000
	1913 115,000	2,760,000	1,408,000
Rye	1914 17,000	246,000	221,000
	1913 17,000	230,000	200,000
Potatoes	1914 48,000	2,592,000	2,100,000
	1913 48,000	3,984,000	3,586,000
Hay	1914 698,000	a 640,000	11,008,000
	1913 740,000	925,000	13,782,000
Tobacco	1914 10,800	b 8,856,000	974,000
	1913 15,000	10,200,000	1,224,000

a Tons. b Pounds.

MINERAL PRODUCTION. With a production in 1913 exceeding for the first time in its history a total of 70,000,000 tons, West Virginia became firmly established as the second in rank among the coal-producing States. The total production was 71,308,982 tons, or an increase of 4,522,295 short tons over the output of 1912. The increased production was accompanied by a considerably larger gain in value, which showed an increase over 1912 of \$9,079,931, or 14.46 per cent, the value of the output in 1914 being \$71,872,165. The production increased in 1913 in spite of labor troubles in the Paint Creek and Cabin Creek districts of the Kanawha field, which began in the early part of 1912, and were not settled until well into the spring of the following year. The floods in the Ohio Valley in the spring also reduced shipments to the West for a considerable length of time. Of the total increase of over 4,500,000 tons, the increase in the quantity of coal made into coke in 1913 was only 75,585 tons, indicating that

coke making in the State fell relatively behind; this does not mean, however, that less coke was made from West Virginia coal. Large quantities of the coal are made into coke in ovens located outside the State, and in 1913 the coal shipped from West Virginia mines for coking at distant ovens was about twice as much as that used for the same purpose in the State. There was an increase of nearly 10 per cent in the number of men employed in 1913 over 1912. The coal production of the State in 1914, according to the estimates of the United States Geological Survey, showed an increase of nearly 4,550,000 short tons over 1913. The production in some of the older districts was materially reduced, but this was partly made up by a number of new mines. The production of coke in 1914 is estimated at not much more than 55 per cent of that of 1913, but a part of the decrease in coke production is attributed to the increased use of by-product coke, none of which is made at the mines.

Second in importance among the State's mineral industries is natural gas, which, in 1913, was valued at \$34,164,850, compared with \$33,324,475 in 1912. Third in importance is petroleum, the output of which decreased from 12,128,962 barrels in 1912 to 11,567,299 barrels in 1913, but, on account of the sharp advance in prices in the latter year, the total value increased from \$19,927,721 to \$28,828,814. Next to fuels the clay products of the State are the most important of its mineral industries, and of the total value of the clay products, the potteries contributed over 60 per cent. In 1913 the total value of the clay products was \$5,208,270, of which the pottery products contributed \$3,424,887. In 1912 the total value of the clay products was \$4,775,874. The principal quarry product of the State is limestone. The total value of the stone produced increased from \$1,164,877 in 1912, to \$1,193,323 in 1913. Other mineral products of importance are sand and gravel, aluminum, bromine, calcium chloride, grindstones, iron ore, mineral waters, and salt. The total value of the mineral products increased from \$123,847,812 in 1912, to \$143,640,633 in 1913.

TRANSPORTATION. The total mileage of railroads in the State, including only the main track, was in 1914, 3625. There were, in addition, 510 miles of second track, and 125 miles of branches. Railroads having the greatest mileage are the Baltimore and Ohio, 1063; Chesapeake and Ohio, 703; Norfolk and Western, 443; Western Maryland, 197; and the Virginian Railway Company, 119.

EDUCATION. The total school population in 1914 was 399,845, the total enrollment being 299,135, and the average daily attendance 208,004. The total number of teachers was 9820, and the average yearly salary paid to these was \$349.35. Among the acts relating to education passed by the Legislature in 1913, were those providing for public drinking cups and creating a county financial secretary. Several important recommendations in respect to schools will be made to the Legislature of 1915.

FINANCE. The report of the State Treasurer issued in 1914 covers a period of 21 months, from Oct. 1, 1912, to June 30, 1914. The Legislature of 1913 changed the fiscal year from October 1 to September 30, to July 1 to June 30. This report shows a balance on June 30, 1913,

of \$683,466. The receipts for the fiscal year ending June 30, 1914, were \$6,964,377, and the disbursements for the same period were \$6,691,537, leaving a balance on June 30, 1914, of \$956,306.

CHARITIES AND CORRECTIONS. The charitable and penal institutions of the State are under the supervision of the State Board of Control, and with their populations for the year ending Oct. 31, 1914, they are as follows: West Virginia Hospital for the Insane at Weston, 1023; Second Hospital for the Insane at Spencer, 552; West Virginia Asylum at Huntington, 625; Miners' Hospital No. 1, at Welch, 54; Miners' Hospital No. 2, at McKendree, 28; Miners' Hospital No. 3, at Fairmont, 38; West Virginia Penitentiary at Moundsville, 1202; Industrial School for Boys at Grafton, 305; Industrial Home for Girls at Industrial, 104; State Tuberculosis Sanitarium, 58; West Virginia Colored Orphans' Home at Huntington, 64; West Virginia Childrens' Home at Elkins, 24. The total expenditure for maintaining these institutions during the fiscal year ending June 30, 1914, was \$668,493.70.

POLITICS AND GOVERNMENT. The State Legislature had no meeting in 1914, as the sessions are biennial, and the last was held in 1913. The year was of small importance politically, as the only elections held were for representative to Congress. At the election of November 3 the Democrats elected representatives in three districts, and the Republicans elected their candidates in the fourth and fifth districts and a representative-at-large. An explosion in the New River Collieries Company's mine at Eccles on April 28 resulted in the death of about 180 miners who were entombed in the mine.

On July 1 a drastic Prohibition law went into effect. A constitutional amendment providing for State-wide prohibition was carried in 1912, and the Legislature of 1913 enacted a measure putting the amendment into effect. This bill, known as the Yost Bill, is perhaps the most stringent law enforcement measure on the statute books of any State. Under its provisions it is unlawful to manufacture, sell, or give away intoxicating liquors anywhere within the State. It is also unlawful to ship intoxicating liquors to violators of the law. Druggists and club houses are prohibited from selling intoxicating liquors, and it is unlawful to advertise liquors by bill posters, circulars, newspapers, or otherwise in the State. Any violation of this law is punishable by fine or imprisonment in the county jail for first offense, and by fine and imprisonment in the State penitentiary for second offense. The law provides for a superintendent of prohibition, who has general supervision of the State, and power to see that the laws are enforced.

STATE GOVERNMENT, 1915. Governor, Henry D. Hatfield; Secretary of State, Stuart F. Reed; Superintendent of Free Schools, M. P. Shawkey; Auditor, John S. Darst; Commissioner of Agriculture, Howard E. Williams; Attorney-General, A. A. Lilly; Treasurer, E. L. Long; Adjutant-General, John C. Bond—all Republicans.

JUDICIARY. Supreme Court of Appeals: President, William N. Miller; Associate Judges, George Poffenbarger, Ira E. Robinson, L. Judson Williams, Charles W. Lynch; Clerk, W. B. Matthews—all Republicans.

STATE LEGISLATURE, 1915.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Republicans	20	57	77
Democrats	10	29	39
Republican majority	10	28	38

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WEST VIRGINIA UNIVERSITY. A State university for higher education, founded in 1867, at Morgantown, W. Va. The students enrolled in all departments of the university in the autumn of 1914, were 775, and the faculty numbered 80. There were several notable changes in the faculty during the year, among which were the resignation of Thomas E. Hodges, president of the university, and the appointment of Dr. Frank Butler Trotter, acting president; resignation of acting Dean Wells and the appointment of Professor H. C. Jones as dean of the College of Law; Dr. C. B. Cannaday was appointed professor of Latin, and Dr. F. E. Clark professor of chemistry. A School of Pharmacy was established, with Charles H. Rogers at its head. There were no noteworthy benefactions received during the year. The productive funds of the university amount to \$104,000, and the income from this to \$6000. The library contains 47,000 volumes.

WEYERHAEUSER, FREDERICK. An American lumberman and capitalist, died April 4, 1914. He was born in Neidersaulheim, Germany, in 1834. When he was 18 years of age he removed to the United States and went first to Erie, Pa. Four years later he removed to Rock Island, Ill., and secured work in a saw-mill, where within six months he became manager of the plant, and shortly afterwards with a partner, purchased it. Mr. Weyerhaeuser realized the importance of obtaining possession of valuable timber properties in Wisconsin, the resources of which were at that time practically unknown. In 1864 he had become financially able to purchase a large tract in northern Wisconsin on which he erected a number of saw-mills, and eight years later he formed an organization known as the Weyerhaeuser Syndicate. He was later elected president of the Mississippi River Boom and Logging Company, and that company became the main company of the great lumber system which he afterwards formed. He continued to organize new companies and purchase lumber land and he finally secured nearly all the timber land worth owning in the Mississippi River lumber district; and in every company that he organized he was the dominating figure.

In 1891 he removed to St. Paul, and from this city he directed the operations of his companies. With him was associated Robert L. McCormick, and they became known as the timber agents of the Northern Pacific and Great Northern Railroads. In 1897 Congress passed as a rider to the Sundry Civil Bill, a provision which permitted the holders of land within forest reserves to relinquish their tracts to the government and to select in place of them other tracts open to settlement; as a result of this the railroads relinquished thousands of acres of worthless land and obtained in exchange the possession of timber lands. The officers of the railroads working through the Weyerhaeuser companies are said to have sold great tracts of these lands to the

Weyerhaeuser Syndicate for absurdly small sums, \$6 an acre being reported as the average price. The property thus acquired was 1,000,000 acres of timber land lying west of the Cascade Mountains. This was but one of a number of similar transactions. In Oregon he owned a tract of 600,000 acres, and in northern Idaho had control of companies whose assets were known to be over \$26,000,000. Other companies were owned and directed by him throughout northern and western sections of the United States. As a result of these holdings Mr. Weyerhaeuser was often called the richest man in the world, although personally he was little known outside of the regions in which his operations were conducted. It was often charged that the syndicate which he operated was in reality a lumber trust and that as a result of his operations, prices of lumber were greatly increased. He denied this, and asserted that the high prices were due to the scarcity of lumber. At the time of his death it was estimated that his wealth amounted to \$500,000,000.

WHEAT. The world's wheat production, as based on the crop statistics and estimates published from year to year, shows an approximate increase of 300,000,000 bushels for the decade ending with 1900 over the preceding 10 years, and of 700,000,000 bushels for the decennial period ending with 1910 over the decade ending in 1900. This increase was mostly due to a larger acreage, but also to some extent to a higher average yield per unit of area. The world's crop of 1914 was estimated by the International Institute of Agriculture as about 9 per cent under the crop of 1913, which was 4,124,900,000 bushels, the highest on record. It was pointed out that while the diminution as compared with the previous year, was quite large, the production was nevertheless over 15 per cent above the average for the 10 years 1903-1912. The aggregate shortage as compared with 1913, so far as data were at hand, was estimated by the United States Department of Agriculture at more than 386,000,000 bushels, and the shortage for Europe alone at 323,000,000 bushels. As a result of the war in Europe, which largely upset transportation facilities, there was a general rise in prices during the latter part of the year, but the increase was determined mainly by the geographical position of each individual country, as well as by its belligerency or neutrality. The countries reporting increased yields over 1913 were the United States, the United Kingdom, Spain, the Netherlands, and Bulgaria. In Australia the crop of 1913-14 was also larger than the preceding crop. The Canadian wheat crop, reduced by drouth and winter-killing, more than 200,000 acres being winter-killed in the provinces of Ontario and Alberta, was estimated at nearly 160,000,000 bushels, or over 70,000,000 bushels less than the production of 1913.

The United States produced in 1914 the largest wheat crop in its history. The production of spring and winter wheat, as estimated by the Department of Agriculture, amounted to 891,017,000 bushels from 53,541,000 acres, the average acre yield being 16.6 bushels. The total value of the crop, based on a bushel value of 98.6 cents, the average price received by farmers on December 1, reached \$878,680,000. With the exception of the bushel value these were all record figures. In 1913 the production was 763,380,000 bushels on 50,184,000 acres, the

average yield 15.2 bushels per acre, and the total value, based on the corresponding bushel value of 79.9 cents, \$610,122,000. The production of winter wheat was exceptionally large, and was considered the largest ever produced by any country. The seasons were favorable to the growth of the crop, and the grain was harvested in good condition. An output of 684,990,000 bushels was secured from 36,008,000 acres, the rate of yield being 19 bushels per acre. The total value of the crop at 98.6 cents per bushel amounted to \$675,623,000. These figures for winter wheat, excepting again the price per bushel, were also the highest on record. In 1913, 523,561,000 bushels were grown on 31,699,000 acres, the average yield per acre being 16.5 bushels, and the total value at 82.9 cents per bushel, the average price on December 1, \$433,995,000. Kansas was by far the leading winter wheat State in 1914, with a production, as reported by the State Board of Agriculture, of 180,924,885 bushels from 9,061,971 acres, the average yield being 19.85 bushels per acre, the highest since 1889. The value of this crop was estimated at \$151,583,031. The States ranking next to Kansas, as reported in the *American Agriculturist*, were Nebraska, with 59,375,000, Illinois with 51,000,000, Oklahoma with 47,025,000, Indiana with 44,460,000, and Missouri with 43,180,000 bushels. The highest average acre-yield, 26 bushels, was secured in Washington, Montana and Oregon ranking next with 24 bushels, and New York and Iowa with 23 bushels.

The spring wheat production, in 1914, was below normal as the result of drouth and attacks of rust in certain sections. The production amounted to 206,027,000 bushels on 17,533,000 acres, the average acre-yield being 11.8 bushels. The preceding year 239,819,000 bushels were produced on 18,485,000 acres, the average yield being 13 bushels per acre. The total value of the 1914 crop at 98.6 cents per bushel was \$203,057,000, as compared with \$176,127,000, the value of the preceding crop, based on the corresponding bushel value of 73.4 cents. The leading spring wheat States and their yields, as given in the *American Agriculturist*, were as follows: North Dakota 84,568,000 bushels, Minnesota 38,742,000, South Dakota 35,260,000, Washington 24,420,000, and Montana 11,280,000 bushels. The highest average yield per acre, 24 bushels, was reported for Montana, but the average yield for all the New England States, with a total of only 5000 acres, was given as 27 bushels.

WHISKY. See LIQUORS.

WHISTLER, GARLAND NELSON. American soldier, died June 26, 1914. He was born in New York City in 1847, entered the United States army as second lieutenant of the field artillery in 1867, and was promoted to be first lieutenant in 1874 and captain in 1898, in 1905 becoming lieutenant-colonel and in 1907 colonel. He was for many years in command of the school of submarine defense at Fort Totten and was a noted authority on explosives. Colonel Whistler was a second cousin of James McNeill Whistler, the artist, and was of the fourth generation of a family of soldiers, being the son of Joseph Nelson Garland Whistler.

WHITNEY, SIR JAMES PLINY. A Canadian statesman, died Sept. 25, 1914. He was born in Williamsburg, Ontario, in 1843, and was educated in the public schools of that city. He

studied law and in 1870 became a barrister, practiced at Morrisburgh, and became one of the leaders of the bar in that part of Canada. In 1890 he was made Queen's Counsel, and in 1888 was elected representative of the county of Dundas in the Provincial Legislature. He was leader of the opposition, and after the defeat of the Ross government in 1905 was called upon to form a new government. From that year until his death he was Premier and President of the Council of Ontario. He received the degrees of LL.D. from Toronto University and Queen's University, and the degree of D.C.L. from Trinity University.

WIDOWS' PENSIONS. See **PENSIONS FOR MOTHERS.**

WILBOUR, MRS. CHARLOTTE BEEBE. An American woman suffrage leader, died in New York City, Dec. 25, 1914. She was born at East Hartford, Conn., March 2, 1833, and was educated at the Wilbraham (Mass.) Academy. In 1858 she married Charles Edwin Wilbour of New York City, an Egyptologist. Eloquent as a public speaker, she became one of the pioneer leaders of the woman suffrage movement in America, and was associated in that work with Susan B. Anthony and Elizabeth Cady Stanton. It is said that because women were excluded from the New York Press Club dinner to Charles Dickens, Mrs. Wilbour, with the aid of Mrs. Jane C. Croly ("Jennie June") and Miss Kate Field, founded, in 1868, the Sorosis Club, the first incorporated woman's club in the United States. Of this organization she was president in 1870-75, and from 1903 to 1907, when she retired as honorary president. From 1875 to 1900 she lived abroad with her husband. She published *Sabbath School Dialogues*, and a volume of essays under the title *Soul to Soul*.

WILBUR, HENRY W. An American editor and author, died Sept. 7, 1914. He was born at Easton, N. Y., in 1851, and was educated in the public and high schools of Vineland, N. J., beginning editorial work in 1875. From 1876 to 1884 he was editor of the *Vineland Independent*, and was on the editorial staff of the *New York Voice*, a Prohibition organ from 1896 to 1898. He was a recorded minister of the Religious Society of Friends and was general secretary of the Friends' General Conference, and of the Committee for the Advancement of Friends' Principles. He was also president of the National Federation of Religious Liberals. His writings include: *A Study in Doctrine and Discipline*; *Five Weeks in England*; *Life and Labors of Elias Hicks*; *Job Scott, an Eighteenth Century Friend*; *Five Points from Barclay*; *Nature Stories from Darwin*; and *Development of the Spiritual Perceptions* (1914).

WILKEITE. See **MINERALOGY.**

WILLARD, CHARLES ANDREW. An American jurist, died March 15, 1914. He was born in St. Johnsbury, Vt., in 1857, and graduated from Dartmouth College in 1877. He then studied law at Boston University, taking the degree of LL.B. in 1879, and from that year until 1882 he practiced law at St. Johnsbury. He then removed to St. Paul, Minn., where he was in practice until 1885, from which year until 1901 he continued his practice in Minneapolis. In the latter year he was appointed associate justice of the Supreme Court of the Philippine

Islands, serving in this post until 1909 when he became United States district judge for the District of Minnesota. From 1887 to 1901 he was lecturer on the law of bailments at the University of Minnesota.

WILLIAM M. RICE INSTITUTE. An institution for liberal and technical education, incorporated in 1891, in Houston, Texas. The institution opened for students in 1912 with freshmen only, but in the autumn of 1914 freshmen, sophomores, and juniors were admitted. The total enrollment at that time was 255, from 15 cities and 75 towns in Texas. The faculty numbered 35, and more than doubled in size during the year. There were no noteworthy benefactions received during the year. The endowment of the university amounts approximately to \$10,000,000, and the income to approximately \$500,000. The president is Edgar Odell Lovett.

WILLIAM OF WIED, PRINCE. See **ALBANIA, History.**

WILLIAMS, JOB. An American educator, died March 15, 1914. He was born at Pomfret, Conn., in 1842, and graduated from Yale College in 1864. In 1866 he became a teacher of the deaf in Hartford, Conn., and from 1879 until his death was principal of the American School for the Deaf, the pioneer institution of its kind in America.

WILLIAMS, MORGAN BRANSBY. An English engineer and railway builder, died June 22, 1914. He was born in 1825 in Bridgend, Glamorgan, Wales, and was educated at the Cowbridge Grammar School. He began life as a mining engineer, but subsequently became a civil engineer. He was engaged in the construction of the London and Northwestern Railway, the Caledonian, the London and Southwestern Railway, and also in railway building in Italy. He constructed many hundreds of miles of line in Russia, where he was chief resident engineer under Sir John Hawkshaw, and for several years general manager of one of the Russian roads. His work in that country brought him many marks of favor from Alexander II. After retiring from service in Russia he took an active part in the public life of South Wales. He probably had more to do with the construction of the first great systems in England than any other man.

WILLIAMS COLLEGE. An institution for higher education at Williamstown, Mass., founded in 1793. The total enrollment in the autumn of 1914 was 499, and the faculty numbered 59. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds amounted, at the end of the college year 1913-14, to \$1,842,243, and the income to \$222,747. The library contains about 78,000 volumes. The president is Henry A. Garfield, LL.D.

WILSON, ELLEN LOUISE (AXSON), wife of President Woodrow Wilson, died Aug. 6, 1914. Mrs. Wilson's paternal grandfather was a distinguished clergyman in Savannah, and her grandfather on her mother's side was the Rev. Nathan Hoyt, for many years pastor of the Presbyterian Church at Athens, Ga. Her father was pastor of a church at Rome, Ga., where she met and became engaged to Mr. Wilson, who was at that time practicing law in Atlanta. In 1885 they were married at Savannah. After her

marriage Mrs. Wilson divided her time between household duties and painting. She had considerable ability as an artist and produced several canvasses which were exhibited in New York City and elsewhere. At Princeton, when Woodrow Wilson was president of the university, Mrs. Wilson entered heartily into all the social activities of the university and was a great favorite of the students. When she went to Washington she seemed to be in the best of health. Beside doing her full share in maintaining the White House as the social centre of the city, and endeavoring to relieve her husband of burdensome obligations, whenever possible, she became actively interested in the welfare movement in the capital and made personal excursions to its slums and alleys in an effort to gain first hand information and to promote reforms. She was greatly interested also in the conditions under which young women work in the government departments. In February, 1914, she was injured by a fall on the marble floor of the White House and this was followed by a general nervous breakdown, which was accelerated by the strenuous social season, and overexertion in social betterment work and other humanitarian endeavors. At the time of her final illness there was pending in the House a measure abolishing the alley system in Washington, and this, by a special action of Congress, was passed before her death. Mrs. Wilson was honorary president of the Southern Industrial Education Association and of the women's department of the National Civic Federation. She was also a member of many other art and philanthropic societies.

WILSON, JAMES GRANT. An American soldier and writer, died Feb. 1, 1914. He was born in Edinburgh, Scotland, in 1832, and in the following year his father brought the family to America. The son was educated by private tutors and for a time he assisted his father in the publishing business in Poughkeepsie, N. Y. He later turned to journalism and in 1857 founded the *Chicago Record*, the first literary paper in the Northwest. In 1862 he was commissioned major in the Fifteenth Illinois Cavalry, and accompanied General Grant to New Orleans. By the latter's advice he accepted the colonelcy of the Fourth Regiment of the United States colored cavalry in 1863, and for the two years following he was aide to Gen. N. P. Banks. In 1865 he was brevetted brigadier-general for faithful and meritorious services, and in June of the same year resigned from the army and returned to New York City which was his home for the remainder of his life. He engaged in literary work and was the author of a large number of biographies and historical works. He gathered together a remarkable library and a rare collection of letters, pictures, autographs, and other mementoes of famous persons he had known. These included: Washington Irving, William Cullen Bryant, and American authors down to the present generation; Presidents from Lincoln to Wilson; Dickens, Thackeray, Gladstone, and other Europeans and continental persons of note. His first published book was *Sketches of Illinois Officers*, issued in 1862. The works which followed included: *Mr. Secretary Pepsys and His Diary* (1867); *Life of Fitz-Greene Halleck* (1869); *Sketches of Illustrious Soldiers* (1874); *Bryant and His Friends* (1886); *Life of General Grant* (1897); *The Presidents of the United States, 1789-1901*

(1902); *Thackeray in the United States* (1904); *Commodore Isaac Hull and the Frigate Constitution* (1910). He also edited many books of reference and several series of historical works, which include: *Appleton's Cyclopædia of American Biography*, and *Memorial History of the City of New York*. He received the degree of D.C.L. from St. Stephen's College, L.H.D. from Hobart College, and in 1909 he was vice-president of the Hudson-Fulton Commission.

WILSON, PRESIDENT. See INTERNATIONAL ARBITRATION AND PEACE, *President Wilson's Offer of Mediation*; UNITED STATES, *passim*.

WINCHELL, NEWTON HORACE. An American geologist and archaeologist, died May 2, 1914. He was born in North East, Dutchess Co., N. Y., in 1839, graduated from the University of Michigan in 1866, and in the same year became superintendent of public schools at Adrian, Mich., serving until 1869. He was assistant State geologist in 1869-70, and from 1870 to 1872 was assistant in the geological survey of Ohio. From 1870 to 1900 he was State geologist of Minnesota, serving at the same time as professor of geology and mineralogy at the University of Minnesota, which chair he held until 1900. From 1906 until the time of his death he was archaeologist for the Minnesota Historical Society. In 1888 he founded *The American Geologist* and was the editor of this publication until 1905. He was founder and three times president of the Minnesota Academy of Sciences and was a member of many other American and foreign scientific societies. His published writings include: *Catalogue of the Plants of the State of Michigan* (1861); *Geology of Ohio and Minnesota* (1872-1900); *The Iron Ores of Minnesota* (with Horace V. Winchell, 1891); *Elements of Optical Mineralogy* (with Alexander N. Winchell, 1909); and *The Aborigines of Minnesota*, as well as many papers contributed to scientific journals.

WINDWARD ISLANDS. A group of British West Indian colonies—St. Lucia, St. Vincent, and Grenada; together with the Grenadines, attached partly to Grenada, and partly to St. Vincent. See articles on separate colonies. Geographically, Barbados, Trinidad, and Tobago belong to the group, and were formerly associated with it politically. The three colonies are united for administrative purposes under one Governor (Lieut.-Col. Sir James Hayes-Sadler in 1914), residing at St. George's, Grenada.

WINES. See LIQUORS.

WINSLOW, HERBERT. A rear admiral (retired) of the United States navy, died Sept. 25, 1914. He was born at Roxbury, Mass., in 1848, and graduated from the United States Naval Academy in 1869. He was appointed ensign in 1870 and was promoted to be master in 1872, lieutenant in 1875, lieutenant-commander in 1897, commander in 1900, captain in 1905, and rear admiral in 1909. While on duty on the *Saramac* in 1875, with the rank of lieutenant, the vessel was wrecked in Seymour's Narrows, British Columbia, and Lieutenant Winslow was the last man to leave the ship. During the Spanish-American War he commanded the dispatch boat *Fern*, which took part in the battle of Santiago. At the time of the Boxer uprising in China in 1900 he was in command of the *Solace* on the Asiatic station, and landed the first detachment of marines at Taku. His last

active duty was at the Boston Navy Yard. He was retired in 1910, and from that year until his death lived at Cherbourg, France.

WIRELESS TELEGRAPHY AND TELEPHONY. Considerable progress was made during the year in the construction of radio stations of great power, as well as in the perfection of apparatus designed to furnish sustained waves of particular frequencies. This was especially true, also, in connection with radio-telephony, which, while not yet in the commercial stage of development, was nevertheless successfully carried on by several experimenters in various parts of the world. The United States navy completed a powerful radio-station at Chelsea, Mass., destined to be one of a great chain of such stations extending from Portland, Maine, down the Atlantic Coast, and including a station under construction at Panama, thence up the Pacific Coast to Alaska, several of which stations will be able to communicate with those at Honolulu, and in the Philippines. The Arlington radio-station, mentioned in the 1913 YEAR BOOK, began, during the year, sending out regular time signals twice daily, at noon and at 10:00 P. M. These were found to be of increasing value as evidenced not only by the number of small radio-sets installed in the various cities and towns to receive standard time, but also on account of the great value to vessels at sea, whose navigators were thus able to check their chronometers even when, as was reported in one case, the ship was in South American waters, more than 4000 miles distant from Arlington. Similar signals were sent out from Key West and New Orleans. In addition to these, the government radio service was of the greatest value in disseminating warnings of approaching storms.

An interesting application of the principles of radio apparatus was used in a device installed during the summer of 1914, by the New York Edison Company, for announcing the approach of lightning storms; this gave warning of atmospheric disturbances of this kind as much as two hours before their actual visibility in the sky. The darkness caused by these storms, being of course accompanied by a great increase in the demand for electricity on the lighting circuits, the new wireless device gave ample warning to the central station attendants, so that additional boilers and generating units could be started up. The station was equipped with a detector apparatus, similar to that of a low-power radio outfit, the coherer of which had in its circuit an electric bell and battery, thus announcing the proximity of a storm.

At the close of the year the Marconi Company had begun work on a wireless station near Astoria, Oreg., said to be the most powerful on the Pacific Coast, that would be able to send 3500 miles at night, and was to cost about \$80,000. In India powerful radio-stations were opened at Carachi, and Butcher Island, Bombay, with a sending range of 600 miles.

A number of inspectors of the Bureau of Navigation of the Department of Commerce of the United States were regularly employed in making tests of the wave-length and logarithmic decrement of the sending apparatus at all public radio shore stations, as well as those on vessels in United States ports. The conditions fixed by the radio communication laws as to

sending wave lengths, the shape and kind of wave length, and the logarithmic decrement, were investigated by the use of a portable decremeter devised at the United States Bureau of Standards by F. A. Rolster. These periodical examinations resulted in raising the general standard of radio service, and rendering it more satisfactory not only under ordinary conditions, but in cases of danger and disaster as well.

The aspect of radio communication as regards patents was interesting. During the year, while a great many patents were issued, most of them were granted on previous applications for improvements of detail. Many cases occupied the attention of the United States Courts, among the most important of which were the basic claims of Marconi and Feasenden, which were sustained on broad grounds, and suitable injunctions regarding infringements issued.

The United States army was making field tests of what was probably the most powerful portable wireless station built. It was carried on the chassis of a motor truck, had a sending range of 800 miles, and could receive from a distance of 2500 miles. The propelling motor of the truck was arranged to drive the generator supplying current to the apparatus, and an 85-foot mast packed in 9 sections was carried with the outfit. When brought to the desired point this station could be set up complete for sending messages within 12 minutes.

The outbreak of the European War brought about many interesting developments in connection with transatlantic radio service. The proclamation by President Wilson on Aug. 5, 1914, concerning neutrality, was supplemented by a specific order prohibiting radio stations within the jurisdiction of the United States from transmitting or receiving messages of an unneutral nature, and from in any way rendering to any of the belligerent powers any unneutral service during the continuance of hostilities. Enforcement of the order was delegated to the Secretary of the Navy, and immediately the more important stations of Tuckerton, N. J., Sayville, N. Y., Cape Cod, Mass., and Portland, Maine, as well as a number of amateur stations at various places along the coast, were closed except in accordance with the conditions of this order. The station at Sayville, L. I., that had communicated regularly with that at Nauen, Germany, was closed by the government, but shortly after the declaration of war was reopened in charge of a censor. The Tuckerton, N. J., station was also taken in charge by the government authorities, and some comment was caused by the interruption to its operations which occurred. This, being due to an accident to the generator, however, was subsequently repaired, and the station resumed communication with that at Eilvese, Germany. The well-known difficulty of securing facts concerning the operations of the forces engaged in the European War made it impossible to obtain more than a few instances of the great advantage secured by the use of wireless apparatus, both in the navy and between land stations. It was reported that German Zeppelins were using a type of radio set weighing only 50 pounds, that possessed a daylight working range of 125 miles, and British aeroplanes were said to have made successful use of a set weighing only 15 pounds

that could communicate with points 20 miles away.

After the war had been in progress a few weeks many reports were published in the American daily press of the existence of suspicious wireless stations in various localities, particularly along the Atlantic and Pacific Coasts. In most instances, however, these were found, on investigation, to be amateurs' outfits, with a very limited sending range, and entirely innocent of any unneutral communications.

RADIO-TELEPHONY. The principal difficulty met by investigators in radio-telephony seemed to be that of developing instruments capable of transferring the delicate modulations of the comparatively feeble sound waves of the voice to the antennae at the sending station, which obviously required large amounts of energy in order to transmit to great distances. In France, the Colin-Jeance system was considerably developed during the year. From the transmitting station at Paris satisfactory conversation was maintained with another 62 miles away. In this system, radiations, of sufficiently high frequency for speech transmission, were secured by enclosed arcs produced in an atmosphere of mixed hydrogen and acetylene, and a microphone or group of microphones equipped with a megaphone, into which the operator talked, was placed in the circuit. It was stated that the best results were secured with a wave length of approximately 1000 meters.

The Union Pacific Railroad was working on a system of wireless telephone communication between stations and moving trains, and it was reported that satisfactory conversation had been secured at a distance of 100 miles. Signor Marconi made extensive investigations during the year on the possibilities of radio-telephony, and devised apparatus that enabled him to communicate successfully between Rome and Vienna, 600 miles; to vessels in the Mediterranean, nearly 400 miles away; and on several occasions between Rome and Clifden, Ireland, a distance of 1750 miles. All these results were secured in daylight transmission.

WISCONSIN. POPULATION. The estimated population on July 1, 1914, was 2,446,716. The population in 1910, was 2,333,860.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

	Acreage	Prod. bu.	Value
Corn 1914	1,725,000	69,862,000	\$45,410,000
..... 1913	1,650,000	66,825,000	40,095,000
Wheat 1914	184,000	3,511,000	3,511,000
..... 1913	190,000	3,665,000	3,005,000
Oats 1914	2,300,000	62,100,000	26,703,000
..... 1913	2,275,000	83,038,000	30,724,000
Barley 1914	675,000	18,428,000	11,425,000
..... 1913	725,000	18,125,000	10,875,000
Rye 1914	412,000	6,798,000	6,186,000
..... 1913	425,000	7,438,000	4,240,000
Potatoes ... 1914	304,000	37,696,000	11,309,000
..... 1913	295,000	32,155,000	17,364,000
Hay 1914	2,550,000	a 4,462,000	41,497,000
..... 1913	2,375,000	3,848,000	42,713,000
Tobacco ... 1914	45,600	b 53,808,000	5,919,000
..... 1913	43,000	50,740,000	6,089,000

a Tons. b Pounds.

MINERAL PRODUCTION. The chief mineral product of Wisconsin is zinc, which represents nearly 25 per cent of the total value of the min-

eral products of the State. Wisconsin leads all the States in the value of mineral waters produced, this value being, however, only about one-fourth that of the zinc produced. In the production of primary spelter Wisconsin ranks fourth among the States, but when the zinc content of the ores mined is considered, New Jersey takes precedence over Wisconsin, and the latter drops to fifth in rank. The zinc content of the ore mined in Wisconsin decreased from 33,050 short tons, valued at \$4,560,900, in 1912, to 30,110 short tons, valued at \$3,372,320, in 1913. Until 1913, iron ore was second in importance among the mineral products of the State, in which year, however, it was surpassed in value by the clay products. The marketed production of iron ore in 1913 was 896,243 long tons, valued at \$2,149,397, a decrease in quantity from 1,152,250 tons in 1912, and in value from \$2,731,574. The value of the stone produced in the State in 1913 was \$2,157,980, the principal quarry products being limestone and granite. The only other product which exceeded \$1,000,000 in annual value was that of the clay pits, and the value of the clay products decreased from \$1,044,486 in 1912 to \$1,020,028 in 1913. The chief product is common brick. Other commercial mineral products of the State are graphite, lead, mineral paints, pyrite, sand and gravel, sand-lime brick, and silica. The total value of the mineral products decreased from \$14,192,287 in 1912 to \$12,452,480 in 1913.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the following (the populations are given for the year ending Sept. 30, 1914): State Hospital for the Insane at Mendota, 620; Northern Hospital for the Insane at Winnebago, 617; School for the Deaf at Delavan, 186; School for the Blind at Janesville, 116; Industrial School for Boys at Waukesha, 406; Wisconsin State Prison, at Waupun, 752; State Public School at Sparta, 138; Home for Feeble-Minded at Chippewa Falls, 1082; Wisconsin State Reformatory at Green Bay, 244; State Tuberculosis Sanatorium at Wales, 166; Milwaukee Hospital for the Insane, 657; and county asylums for the insane, 5422. The total population of all these institutions was 10,463. They are managed by a central board known as the State Board of Control, which has complete supervision over all institutions, and is also the parole board of the Wisconsin State Prison, the Wisconsin State Reformatory, the Industrial School for Boys, and the Milwaukee County House of Correction. The board has charge also of State probation matters, and all persons placed upon probation by the courts of the State are put under the supervision of the State Board of Control. The Legislature of 1913 provided for two additional institutions, an Industrial Home for Women in Fond du Lac County, and a new Home for the Feeble-Minded and Epileptic in Racine County. The Legislature also authorized the Board of Control to make an investigation of the question of mothers' pensions, and the question of administering outdoor relief, reports of which investigations will be made to the Legislature of 1915. The total expenditures for the maintenance of charitable and penal institutions for the year ending June 30, 1914, was \$1,188,800. There were in the State on that date 35 county asylums, with a population of 5500. Each county

asylum has a large farm connected with it, and ample provision is made for giving the patients an outdoor life. The State has made provision for the care of dependent, crippled, and deformed children, and for the treatment of such children. It has also made provision for the segregation of tubercular chronic insane persons, and those persons have been taken out of the county asylums and placed in separate institutions.

FINANCE. The report of the State treasurer shows a balance on June 30, 1913, of \$1,924,890. The receipts for the fiscal year 1914 amounted to \$21,404,859, and the disbursements to \$19,028,895, leaving the balance on June 30, 1914, \$4,300,854. The State debt at the end of the fiscal year amounted to \$2,251,000. Of this \$1,563,700 was due to school fund.

POLITICS AND GOVERNMENT. The State Legislature did not meet in 1914, as the sessions are biennial, and the last was held in 1913. Elections were held for Governor, and other State officers, for United States Senator, and for representatives to Congress. Primary elections for nominations were held on September 1. The Republicans nominated for Governor, E. L. Philipp, and the Democrats John C. Karel; for United States Senator the Republicans nominated Governor F. E. McGovern, and the Democrats Paul Hustung. The nomination of Governor McGovern was extremely interesting in that his candidacy was opposed by Senator La Follette, and the result of the primary was taken to indicate that the latter's influence in the State had lessened. In the elections of November 3, the Republicans elected their candidate for Governor, who received 140,787 votes, compared with 119,509 for Karel, Democrat, 32,560 for Blaine, Independent-Progressive, 25,917 for Ameringer, Social Democrat, 6279 for Emerson, Prohibitionist, and 352 for Vierthaler, Socialist-Labor.

The vote for Senator was so close that McGovern asked for a recount. Before the recount was completed, however, Hustung brought an action before the Supreme Court and an order was entered requiring that returns be sent in to the Secretary of State as required by statute, notwithstanding the fact that an incomplete recount was in progress, and holding further that the contesting candidate's only recourse was to carry the contest to the United States Senate, a step which was not eventually taken. Mr. Philipp's candidacy for the Governorship was made largely on a campaign of lower taxes and reduced State expenses. On April 7 Gerhard Balding was reelected Mayor of Milwaukee on a non-partisan ticket, defeating the Socialist candidate, Emil Seidel.

The total vote cast in the election was 325,430, compared with 393,849 in the presidential election of 1912. The Republicans showed a loss of 38,573, the Democrats a loss of 47,807, the Social Democrats a loss of 8551, Socialist-Labor a loss of 2901, and the Prohibitionists a loss of 3154. There were no Roosevelt Progressive candidates, Blaine being a La Follette Republican running independently.

The eugenic marriage law passed by the Legislature of 1913, requiring a physical examination of the male applicant for a marriage license, was declared unconstitutional by the Circuit Courts on Feb. 9, 1914, but was upheld by the Supreme Court in a decision holding the

statute to be a valid exercise of the police power.

STATE GOVERNMENT, 1915. Governor, E. L. Philipp; Lieutenant-Governor, E. F. Dithmar; Secretary of State, John S. Donald; Treasurer, Henry Johnson; Attorney-General, W. C. Owen; Superintendent of Education, C. P. Cary; Commissioner of Insurance, H. L. Ekern; all Republicans.

JUDICIARY. Supreme Court: Chief Justice, John B. Winslow, Democrat; Associate Justices, Wm. H. Timlin, Democrat; R. G. Siebecker, Democrat; A. J. Vinje, Republican; Rouje D. Marshall, Republican; J. C. Kerwin, Republican; John Barnes, Democrat; Clerk, Clarence Kellogg, Republican.

STATE LEGISLATURE, 1915.

	Senate	House	Joint Ballot
Republicans	28	57	80
Democrats	6	24	30
Socialists	1	6	7
Nonpartisans	3	13	16
Republican majority	18	14	27

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WISCONSIN, UNIVERSITY OF. A State institution of higher learning at Madison, Wis., founded in 1848. The number of students enrolled in all departments in the autumn of 1914, was 4874, excluding the summer session and winter short course, and the faculty numbered 694, of whom 182 were half time. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds of the university amount to about \$680,000, and the income from this to \$32,810. There were 210,000 volumes in the library. The president is Charles R. Van Hise, Ph.D.

WOMAN'S CHRISTIAN TEMPERANCE UNION, NATIONAL. An organization formed in Ohio, in 1874, for the abolition of the liquor traffic, and for other similar purposes. The Forty-first Annual Convention of this organization was held in Atlanta, Ga., November 12-18, 1914, when reports on all departments of the work were made by the superintendents of these departments. The Union took a prominent part in the prohibition campaigns in the various States during the year, including campaigns in Virginia, West Virginia, Tennessee, and other States in which movements for prohibition were active. The total receipts for the fiscal year 1913-14 amounted to \$158,139, and the total disbursements to \$115,538. In 1914 there were about 12,000 local unions with a membership, including the children's societies, of about 500,000. The World's Woman's Christian Temperance Union, founded by Frances M. Willard in 1883, is organized in over 50 countries with a membership of about 500,000. The National Union has 40 distinct departments, with national headquarters at Evanston, Ill. Its official organs are *The Union Signal* and *The Young Crusader*. The officers of the Union in 1914 were: president, Miss Anna A. Gordon; corresponding secretary, Mrs. Frances P. Parks; treasurer, Mrs. Elizabeth B. Hutchinson.

WOMAN SUFFRAGE, INTERNATIONAL. The movement to extend political rights to women was enthusiastically endorsed by the Interna-

tional Council of Women, whose convention at Rome in May was attended by delegates of 22 different nationalities, representing seven millions of women. When, in the summer, Europe was on the verge of a general war, the Committee of the International Woman Suffrage Alliance, representing 26 countries and 12,000,000 women, presented to Sir Edward Grey and to the ambassadors in London an anti-war manifesto, appealing to them to strive for a pacific settlement of the international crisis. After the outbreak of the War of the Nations, Mrs. Carrie Chapman Catt, the president of the International Woman Suffrage Alliance, arranged for a European suffragist, Mrs. Rosika Schwimmer (Hungary), to come to the United States in the interests of peace. On September 18 Mrs. Schwimmer interviewed President Wilson, urging him to negotiate insistently for the conclusion of an armistice, during which the warring nations might discuss their grievances. Mrs. Schwimmer presented petitions from women's organizations in Australia, Canada, Denmark, France, Holland, Hungary, Italy, Norway, Russia, Sweden, Great Britain, Germany, and the United States.

UNITED STATES. The energetic and well-organized attempts of the suffragist leaders in the United States to obtain the passage of the National Woman Suffrage Amendment Resolution (proposed in the House of Representatives by F. W. Mondell and in the Senate by George E. Chamberlain, April 7, 1913) met with decidedly discouraging results in the early part of the year. As the Judiciary Committee of the House had persistently shelved all woman suffrage resolutions, the partisans of votes for women had demanded the creation of a new House committee especially to deal with questions regarding women's political rights. This project was declined by the Rules Committee of the House of Representatives on January 24, by a tie vote. Shortly afterwards, in their caucus of February 3, the Democrats of the House voted 123 to 57, "That it is the sense of the caucus that the question of woman suffrage is a State and not a Federal question." The decision of the caucus was in effect a direct condemnation of the principle of the National Woman Suffrage Amendment Resolution, which contemplated the enfranchisement of women by amendment of the Federal Constitution. The Resolution came up before the Senate on March 19, and failed to obtain the requisite two-thirds vote, as 35 votes were recorded in the affirmative, and 34 in the negative. Unwilling to admit defeat, Senator Bristow on the following day re-introduced the measure in the Senate. On May 5 the House Judiciary Committee belied its reputation as the "morgue for suffrage resolutions" by reporting the Resolution to the House. Meanwhile an alternative bill had been drafted by Senator Shafroth, providing for a mandatory referendum on woman suffrage in any State on petition of 8 per cent of the legal voters of that State; this measure, it was considered, would be less offensive than the National Woman Suffrage Amendment Resolution to the champions of States Rights. On May 2 the suffragists in the United States celebrated "Woman's Independence Day" with monster mass meetings and demonstrations in almost every State of the Union. At Washington a gigantic parade marched on the capitol and petitioned Congress in favor of votes for women. Less am-

bitious, but perhaps more significant, was the delegation of 500 workingwomen received by President Wilson on February 2. Their leader, Miss Margaret Hinchey, formerly of the New York Laundry Workers, urged the President to use all his influence to "wipe out this great injustice to women." The President was courteous, but pleaded his inability to take up the matter as the leader of a party. On June 30 he told another delegation that woman suffrage was a State issue. The General Federation of Women's Clubs, meeting at Chicago, and representing 1,600,000 women, officially endorsed woman suffrage on June 13. August 15 was "Sacrifice Day" for the woman suffragists, many of whom contributed rings and other jewels for "the Cause." Their devotion was rewarded by the triumph of woman suffrage in two more States in the November elections. Montana and Nevada were added to the list of nine States in which women exercise the franchise: Arizona (1912), California (1911), Colorado (1893), Idaho (1896), Kansas (1912), Oregon (1912), Utah (1896), Washington (1910), and Wyoming (1869). In Missouri, Nebraska, North Dakota, and South Dakota, woman suffrage was defeated. The forty-sixth Annual Convention of the National American Woman Suffrage Association, held in November, at Nashville, Tenn., elected Dr. Anna Shaw of New York president for the ensuing year, and Mrs. Stanley McCormick of New York vice-president.

In Illinois the constitutionality of the Woman Suffrage Act was upheld by a decision of the State Supreme Court in the *Scown* case. The Lower House of the Kentucky State Legislature rejected a woman suffrage amendment on March 11. A similar fate attended a Woman Suffrage Bill in the Maryland Legislature, February 18. In Massachusetts, however, the Woman Suffrage Amendment resolution was passed by 34 votes to 2 in the Senate (March 10), and by 168 to 39 in the House (March 26). If passed by the Legislature again in 1915, the amendment will be referred to the voters of the State. The Senate and Assembly of New Jersey also passed a resolution, which, if passed once more, will enable the voters to decide on the question of woman suffrage. In New York attention was drawn to the woman suffrage campaign at the very beginning of the year by the picturesque "hike" of the redoubtable "General" Rosalie Jones, with her "Colonel" Ida Craft, and a few other stout-hearted soldiers of suffrage. They tramped from New York to Albany, called on Governor Glynn, and presented him with a "Votes for Women" hatband. The Foley-Sullivan Women Watchers Bill, to allow women to act as watchers at the polls, was passed in the New York State Assembly on February 17 by 105 to 8. The New York State Campaign Convention at Rochester in October laid elaborate plans for "victory in 1915," and elected Mrs. Raymond Brown of New York City president of the Association. In Virginia, the House of Delegates rejected a woman suffrage resolution on March 11 by a large majority.

FOREIGN COUNTRIES. In January it was announced officially that the militant tactics of the woman suffragists in Great Britain had occasioned 48 arrests in the preceding 9 months. The "Cat and Mouse" Act, whereby women prisoners were temporarily released when self-imposed abstinence from food endangered their

lives, had been responsible for a decline of militancy. Though less frequent, the acts of violence were still numerous enough. Houses were burned at Comrie, Scotland; an ancient church was fired at Whitekirk, Scotland; a bomb was exploded in St. John's, Westminster; a \$500,000 Velasquez painting was slashed by Mary Richardson; many other valuable canvasses were disfigured; a Burne Jones window was daubed with paint; Bath Hotel was burned; the historic Coronation Chair in Westminster Abbey was damaged by the explosion of a bomb. Burning churches and disfiguring works of art were the most favored methods of the militants. A woman suffrage bill introduced in the House of Lords by Lord Selborne was defeated by 104 to 60 votes, May 6. In June, Premier Asquith consented to receive a deputation of suffragists. After the outbreak of the war, early in August, the militant suffragists became most strenuous supporters of the government, and Mrs. Pankhurst seconded Earl Kitchener's appeals for recruits to fight the Germans.

In Germany, during the month of April, the well-known British suffragist Miss Sylvia Pankhurst was prevented by the police from addressing a Berlin meeting. In Denmark, a constitutional reform bill was passed in June by the Lower House, including a provision to give women the right to vote in Parliamentary elections. In Sweden, on July 2, 350,000 women petitioned Parliament for the right to vote. See **ELECTORAL REFORM; FEMINISM.**

WOMEN AND THE WAR. See **FEMINISM;** and **RED CROSS.**

WOMEN IN INDUSTRY. As in other recent years the problems growing out of the industrial employment of women received much attention. New laws relating to the hours and other conditions of work are noted below. The newest problem in this field is provision for working mothers, especially widows, with minor children, treated under **PENSIONS FOR MOTHERS.** A question receiving great legislative and administrative consideration is the effect of the low wages of women workers, and the provision of that minimum compensation required by health and morals (see **MINIMUM WAGE,** and **PROSTITUTION**). The important judicial decisions affecting the constitutionality of the prohibition of night work in New York, and the limitation of woman's workday to 10 hours in Ohio, are treated below.

LEGISLATION. *The hours and working conditions* of women's labor were affected by legislation in Massachusetts, Mississippi, New York, South Carolina, and Virginia, in addition to the law enacted in the District of Columbia. The amendments to the laws of Massachusetts and South Carolina were slight. Mississippi established a 10-hour day and 60-hour week for women in laundries, millinery, dressmaking, offices, mercantile establishments, theatres, telegraph and telephone offices, and many other occupations, except in case of emergency or public necessity. New York extended its law establishing a 9-hour day and a 54-hour week to include all women over 16 years of age in all mercantile establishments of the State; this law had previously applied to first-class cities only. The latest hour of employment is made 10 P. M.; 9 hours per day may be exceeded only when compensated for by a shorter day of the same week, and a working week may include not more

than six days. The week from December 18 to 24 inclusive is exempted from these restrictions. The lunch time may be reduced below 45 minutes at the discretion of the Commissioner of Labor. Virginia extended its 10-hour law to all women and children under 14 in mercantile establishments in towns over 2000 on Saturdays and to all such working in laundries. Males under 21 and females in that State may not be employed in any capacity where intoxicating liquors are handled, except in hotels and mercantile establishments in the country. Rural canning and fish packing establishments are exempt from this liquor law; and, moreover, bookkeepers, stenographers, cashiers, and office assistants are not included within its scope.

District of Columbia. Early in the year both the Senate and the House by unanimous vote passed the La Follette 8-hour law limiting to 8 hours per day and 48 per week the employment of women in various occupations in the District of Columbia. Nearly every occupation was included except employment in private offices, and as domestic servants in private homes. Hotel servants, clerks in department and other retail stores, and similar workers who frequently are exempted were all brought under the law. The law specified all manufacturing, mechanical, or mercantile establishments, laundries, hotels, restaurants, telephone or telegraph offices, and express and railway companies. This same statute established a 6-day week, and prohibited night work for minors; thus no female under 18 may work in any specified industry between 6 P. M. and 7 A. M. Where three or more females are employed, they may not be employed more than 6 hours continuously without a 45-minute intermission, unless work for the day terminates at 1:30 P. M. Employers must conspicuously post information showing working hours and lunch period; and must keep a time book for every female employee, showing her hours, wages, and lunch period. Enforcement is rendered more effective by the appointment of three inspectors, two of them women, at \$1200 per year. The law resulted from an active campaign by the National Consumers' League, which had made investigations in the District which revealed, among other things, that women worked in steam laundries an average of 12 or 13 hours per day for periods of 2 to 3 months during busy seasons. One of the main objections urged against the passage of this law was that it would result in lowering day wages. This was met by complete evidence showing that a reasonable limitation of length of the working day increases efficiency and consequently wages.

JUDICIAL DECISIONS. *New York.* The New York Legislature of 1913 passed a law forbidding the employment of women in factories between the hours of 10 P. M. and 6 A. M. On December 11, 1913, the Charles Schweinler Press of New York City was charged with violating this law. A similar law of 1903 had been declared unconstitutional in 1907 by the State Court of Appeals on the ground of unwarrantable interference in women's freedom of contract. Moreover, that law had omitted reference to the health of women, whereas the 1913 law was enacted "in order to protect the health and morals of females employed in factories." By a vote of three to two the Supreme Court in July reversed the 1907 decision, the law being

upheld as a proper exercise of the police power in the interest of the public health and welfare. The case was carried to the Court of Appeals. A notable factor of this case was the compilation of a 500-page brief containing scientific, medical, and sociological facts relating to the effects of labor upon the physical and moral status of woman, prepared by Mr. Louis D. Brandeis and Miss Josephine Goldmark, entitled "Facts of Common Knowledge." This compilation revealed to the Court the great attention paid to the question of night work of women during the past 10 or 15 years, and the universality of the opinion that such work is more injurious to women than to men.

Ohio. An Ohio law limiting the hours of labor for women in certain industries to 10 per day and 54 per week was attacked by a milliner who alleged the law to be unconstitutional. The case reached the United States Supreme Court which rendered its decision early in the year, sustaining the law. The attorney-general of Ohio enlisted the aid of Mr. Louis D. Brandeis and Miss Josephine Goldmark in upholding the law. The two last submitted an extensive brief representing the evidence of social workers, economists, factory inspectors, and others, showing the evil effects of long hours on health, morals, and efficiency. The physiology of fatigue was presented. The precedents for the determination of this case were found in the upholding of the Oregon 10-hour law by the same court in 1908; the notable decision of the State Supreme Court of Illinois in 1910, upholding a 10-hour law; and similar subsequent decisions in Massachusetts, Michigan, California, and Washington.

HOME WORKERS IN MASSACHUSETTS. The Bureau of Statistics of Massachusetts in co-operation with the Department of Research of the Womens' Educational and Industrial Union, published a report on "Industrial Home Work in Massachusetts." The inquiry covered 284 employers who were giving out home work to 2409 home workers. Fairly complete information was secured for 134 establishments, estimated to have 20,075 home workers. It was found that wages paid for home work were low, three-fifths of such workers earning less than \$100 per year, and four-fifths earning less than \$150 per year. Few families, however, were found wholly dependent on home work; and few instances of excessive hours and very low wages correlated with extreme economic exploitation were discovered. The inquiry revealed little competition between factories and home workers. It showed that employment in home work was very irregular; that child labor was a conspicuous feature, partially limited by new legislation in 1913. Of the home workers of 16 years of age and over, three-fifths were married women; and over four-fifths of the women home workers had an adult male wage earner in the family. Living conditions in the homes visited were generally good and home work was not confined to the congested tenement districts. The report favored the extension of the laws regarding licensing and inspection of home industries.

STORE WORKERS IN OHIO. The Industrial Commission of Ohio issued a report on "Wages and Hours of Labor of Women and Girls employed in Mercantile Establishments in Ohio in 1913." This report covered 1086 establish-

ments employing a total of 15,744 women and girls. Nearly two-thirds of these were employed in the cities of Cincinnati, Cleveland, Columbus, Dayton, and Toledo. Of the total number of employees, 14,635 were 18 years of age and over. Of these 7.1 per cent received \$4 or less per week; 44.8 per cent received over \$4, but under \$8; 28.8 per cent received \$8 to \$10; but under 20 per cent received more than \$10 per week. Of the 1109 females under 18 years of age, 10.5 per cent received \$2 or less; 21.7 per cent received over \$2, but not over \$3; 31.9 per cent received over \$3, but not over \$4; 23 per cent received over \$4, but not over \$5; and only 1.8 per cent received more than \$7 per week. The Commission concluded that prevailing rates of pay for adult women in mercantile establishments were from \$6 to \$8 per week, while for girls under 18 they were from \$3 to \$5 per week. The Commission assumed that \$8 per week constituted a living wage for women and girls 18 years of age and over, and it found the following percentages of such employees in the mercantile establishments in the cities named receiving less than this wage: Cincinnati, 48.2; Cleveland, 35.7; Columbus, 46.9; Dayton, 53.2; and Toledo, 57.0. Taking \$4 per week as a normal wage for girls under 18, there were found the following proportions of such girls employed in mercantile establishments receiving less than that sum: Cincinnati, 61.4; Cleveland, 28.9; Columbus, 68.8; Dayton, 30.8; Toledo, 28.2.

GREAT BRITAIN. There was issued during the year a volume, based on the census of 1911, which showed that the number of "occupied females" in England in 1911, was 4,831,000, as compared with 4,171,000 in 1901. A striking feature of this report was the great increase in the number of women in professional and semi-professional lines. Medical women had increased from 212 in 1901, to 495 in 1911. Women have increasingly entered medical research, and a number of hospitals exist with women positions only. In the wholesale trades there were 59,944 engaged in 1901, and 126,847 in 1911. In the teaching profession, the proportion of women had risen to 745 in every 1000 schoolmasters, teachers, professors, and lecturers in 1891, but had then fallen to 727 in 1911. This was almost exactly the same proportion as in 1861. There was, on the other hand, an extraordinary advance in the proportion of women among photographers, in commercial and business pursuits, in the telegraph and telephone service, in the boot-making trade, and in tobacco manufacturing. By contrast there was a decline in the proportion of women in the laundry and washing industry, in straw-hat manufacturing, in lace making, and some other trades. As in America, so in England, women are found in many strange occupations, such as shepherdesses, pilots, watchmen, and plumbers. Among the most menial workers were 126,000 charwomen, of whom nearly four-fifths were reported as married.

WOMEN'S CLUBS, GENERAL FEDERATION OF. This body is a federation of the State federations of women's clubs, and has a membership of about 135,000, an indirect membership of about 660,000, and an affiliated membership of about 600,000. The general body provides a programme for the work of the various State clubs. This includes the department of art, bureau of information, department of civics, department of civil service reform, department of conservation, department of education, peace committee, political science committee, department of household economics, department of industrial and social conditions, department of legislation, department of music, department of public health, and department of literature and library extension. These are each under a separate leader. The president, in 1914, was Mrs. Percy V. Pennypacker. The recording secretary is Mrs. Harry L. Keefe; corresponding secretary, Mrs. Eugene Reilley; treasurer, Mrs. William B. Williams.

WOOD ALCOHOL. See ALCOHOL; OCCUPATIONAL DISEASES.

WOODBURY, JOHN MCGAW. An American physician and public official, died Sept. 23, 1914. He was born in New York City in 1856, and graduated from Princeton University in 1879. He later studied medicine at Columbia University and Bellevue Hospital, and then went to Heidelberg and Vienna to improve himself in his profession. He served as division surgeon with the rank of major in the Spanish-American War, and when civil government was established in Porto Rico, Dr. Woodbury was made medical director at Ponce. He at once cleaned up the jails, streets, markets, and stables so thoroughly as to attract more than local attention, and his efficiency resulted in his appointment as Street Cleaning Commissioner of New York City under Mayor Seth Low. He took office on Jan. 1, 1902, and found his department demoralized and a mere part of the patronage machine of political leaders, while the methods of disposing of the city's refuse were costly and unscientific. Dr. Woodbury at once started to alter these conditions, and although his efforts were accompanied by severe criticism and abuse, he continued his reform measures. The material which had previously strewn the beaches of the city after being dumped at sea was taken to a utilization plant at Barren Island and burned; many waste acres of land were reclaimed by filling in with ashes; several plants for burning refuse were established, and from them energy was developed for lighting the Williamsburg Bridge approaches. At the close of Mayor Low's administration, Tammany Hall leaders opened fire on Dr. Woodbury. He was, however, retained during the first administration of Mayor McClellan, but during the second an investigation of the Street Cleaning Department resulted in his administration being condemned. Mr. McClellan refused to remove him, but in October, 1906, he

resigned as the result of a disagreement with the mayor over political appointments.

WORKINGMEN'S INSURANCE. See SOCIAL INSURANCE, and UNEMPLOYMENT, paragraph on *Unemployment Insurance*.

WORKMEN'S COMPENSATION. As stated in the article EMPLOYERS' LIABILITY, a new and just method of enforcing the liability of employers for accidental injuries to their employees has rapidly come into operation, under the name of workmen's compensation. This new method has gained headway solely because of its greater efficiency and especially its greater justice in accomplishing the demands of enlightened public opinion. Preceding 1914 20 States and the United States had enacted laws instituting the compensation principle in place of the old method of employers' liability and suits at law. In 1914, Kentucky, Louisiana, Maryland, and New York enacted new laws. In addition, Indiana, Pennsylvania, and Vermont had commissions at work on the subject.

NEW YORK. The most complete law was that enacted in New York State in December, 1913, and reenacted and approved on March 16, 1914. This law created a Workmen's Compensation Commission of five members, with salaries of \$7000 each, except the chairman, who received \$10,000. In its administrative features, the law became effective March 16, but as to compensation not until July 1. Four methods whereby an employer might meet his new responsibility were provided. He might insure himself in a casualty company, in a mutual company of employers, or in a special State fund; or he might furnish proof of his individual ability to meet contingencies. As a basis for the State fund, employers were divided into 42 groups with insurance rates fixed by the Commission. Any employer failing to comply with the law would thereby lose his benefit of the common law defenses in any employers' liability suit.

A liberal scale of compensations was provided. Thus, for total disability, compensation was made equal to two-thirds of the average weekly wage, whereas in all other States, except Massachusetts in 1914, such compensation equaled only one-half of the weekly wage. The law specified in great detail the compensation to be given for many different accidents, and for various degrees of relationship. A notable provision was the requirement that all compensations, regardless of the method of injury, should be paid through the State Commission.

KENTUCKY AND LOUISIANA. These two States enacted elective laws, but sought to induce employers to come under the compensation principle by abrogating their common law defenses if they failed to do so. The Louisiana law required that notice of acceptance of the law be given at least 30 days before an accident; and the law was made practically compulsory for the first 30 days after entrance upon new employment. In Kentucky the State insurance principle was adopted by the creation of a State fund to which employers subject to the act must contribute, unless of sufficient standing to meet all claims individually. All claims for compensation were to be paid from this fund, and employers were relieved of personal responsibility. Louisiana, on the other hand, merely imposed on the employer the duty of paying compensa-

tion, leaving it to his voluntary initiative to provide the means. The laws of both States were made to apply to a long list of hazardous trades. In Kentucky employers with less than six employees were excepted. In Louisiana, the law is made compulsory upon State and minor civil divisions and employers. The ratio of compensation for total disability was made equal to 50 per cent of weekly wages in both States. Moreover, in Kentucky, no time limit was set in case of permanent disability. The Kentucky law also provided additional benefits as a penalty upon employers violating the labor laws of the State. In Kentucky controversies will be disposed of by a Workmen's Compensation Board; except that on certain points appeal may be made to the Circuit Court. In Louisiana claims are settled by the judge directly.

MARYLAND. The Maryland law was effective as to administrative features April 16, and as to compensation November 1. As in New York, the law is compulsory, and common law defenses are removed in case of failure to comply. The law is also copied after the New York law in those sections setting forth the four methods of providing compensation. Insurance, however, even by the State fund does not, as in New York, remove personal liability. The law covers a very complete list of hazardous occupations; moreover, by voluntary agreements other employments may be brought under the act. Compensations in average amounts are specified for numerous particular interests, total disability being recompensed by 50 per cent of weekly wages. The State Commission created to administer the law may settle claims directly; or they may be settled summarily by a judge; and questions of fact may be determined by trial by jury. The law also contains provisions regarding medical care, burial expenses, dependents, lump sum payments, notice of accidents or injury, nullification of agreement to waive indemnity and other similar provisions designed to insure justice in administration.

CALIFORNIA. The law of 1912 required the reporting of industrial accidents. In the calendar year 1913 there were reported 24,177 industrial accidents, of which 12,106 resulted in disability of more than one week, or death. There were 864 cases of permanent disability and 583 deaths. The estimated wage loss of the 12,106 disabilities totaled \$18,255,000. Altogether 10,721 of these disabilities received some compensation, the total being \$613,832. The average wage loss in cases of temporary disability was \$66.98; in cases of permanent disability \$6392; and in cases of death, \$25,370.

An elective compensation law creating an Industrial Accident Board was passed in 1911. In November, 1911, the constitution was amended so as to permit a compulsory law. This was followed by the Workmen's Compensation Insurance and Safety Act of 1913. The above board was continued as the Industrial Accident Commission, which organized January 1, with Professor Ira B. Cross of Stanford University as secretary. It at once undertook an extensive campaign of education in accident prevention. The act made compensation compulsory on all employers except those in farming, dairying, fruit growing, poultry and stock raising, and domestic service. These may, however,

elect to come under the law; and many hundreds did so. The California law incorporated a unique plan of fixing the compensation for permanent disability. The percentage which actual disability in any case bears to total disability is first determined. Then compensation is provided at the rate of 65 per cent of the weekly wage during a series of weeks proportioned to the above percentage, length of time ranging from 40 weeks for 10 per cent, to 240 weeks for 70 per cent or more. Moreover, where actual disability is 70 per cent or more of total disability, a life pension equal to 10 per cent up to 40 per cent of wages is authorized. The Commission made an extensive study of accidents covering 1400 different occupations. On the basis of this information, statistics furnished by the Workmen's Compensation Service Bureau of New York, and the charges of private casualty companies of California, insurance rates for the State Compensation Insurance Fund created by the law were drawn up. The employer is given the option of insuring in a private stock company, a mutual company, or the State Fund, or of carrying his own insurance. The State Fund proved eminently successful. The safety bureau of the Commission is authorized to issue safety orders and enforce them.

OTHER LEGISLATION. Existing compensation laws were slightly modified in other States. Massachusetts increased the benefits from 50 per cent to 66 $\frac{2}{3}$ per cent of wages, in case of total disability. Death benefits and compensation for partial incapacity must be paid for 500 instead of 300 weeks, the total not to exceed \$4000. The maximum compensation for total incapacity was increased from \$3000 to \$4000. The State Industrial Accident Board may require full information from all insurance companies operating under the act; it may open branches in four cities; and it may appoint a medical advisor; it must make an annual report to the Legislature. The employees of the Boston Transit Commission were brought within the compensation law. Towns and cities were required to submit to popular vote whether civil employees should be brought within the compensation law.

In Nebraska the compensation act of 1913 was sustained by popular referendum. In New Jersey very minor changes in the law were made. New York appropriated \$350,000 for its Workmen's Compensation Commission. In Ohio slight modification was made in the law.

FEDERAL EXPERIENCE. The Bureau of Labor Statistics published an account of "Compensation for Accidents to Employees of the United States" under date of Sept. 17, 1914. This was an account of the first five completed years of the operation of the Federal compensation law enacted May 30, 1908, and effective Oct. 1, 1908. This law applied to manufacturing establishments, arsenals, navy yards, river, harbor, and fortification construction, the reclamation construction work, all employment under the Isthmian Canal Commission, and hazardous work under the Bureau of Mines, the Forestry Service, and the Light House Service. The law provided compensation for injuries causing disability for more than 15 days, or death, provided not due to the negligence or misconduct of the injured employee. Compensation for disability was equal to the pay received previous to in-

jury, but continued for not more than one year. In case of death, compensation equaled one year's wages payable at the same interval as wages, provided the survivors of the killed workman included a widow or children under 16, or dependent parents. The report showed that the number of accidents reported in all departments during the first year (11 months) was 4887; second year, 6989; third year, 9381; fourth year, 10,157; and fifth year, 10,876; or a total of 42,290. There were 1006 fatal accidents reported, of which 90 per cent were covered by the law. The number of claims made rose from 1818 for the first year to 3526 for the fifth year, making a total of 14,936. Of these, 14,046 were allowed, and total compensation was paid amounting to \$1,803,900. Nearly one-half of the accidents and the compensation were due to Panama Canal construction. The average payment for each fatal case was \$704 for the first year, and \$661 for the fifth year. Disability compensations ranged from \$121 for the first year to \$107 for the fifth. Since the law took no cognizance of disability continued for more than one year, no information was secured regarding such cases.

PROPOSED FEDERAL LAW. On April 21, there was reported favorably by the Judiciary Committee of the House a bill to provide compensation for industrial accidents, and occupational diseases of employees of the United States. This law provided that no compensation should be paid where accident or occupational disease was due to the employee's intent to bring about injury or death of himself or another, or due to intoxication of the injured employee. In case of total disability the law provided for compensation equal to two-thirds of the monthly pay during such disability. In case of partial disability compensation was made equal to two-thirds of the difference between previous monthly pay and subsequent wage-earning capacity. Partially disabled employees were required to work, if possible, in order to be entitled to compensation. In case of suspension of work on account of any occupational disease the employee was entitled to a monthly compensation, for total or partial disability as the case might be. Monthly compensation, however, for total disability could not exceed \$66.67, nor be less than \$33.33. The monthly compensation for partial disability might not exceed \$66.67. The United States was pledged by the law to furnish reasonable medical, surgical, and hospital service, and supplies to injured employees or those suffering from occupational diseases.

In case death resulted from an injury or from an occupational disease within six years after injury or the beginning of disability from such disease, the law provided monthly compensations equal to the following percentages of the deceased employee's monthly pay: to a widow with no child or to a widower with no child, but wholly dependent upon the deceased, 35 per cent until death or marriage; to a widow or widower with children, 10 per cent in addition to the foregoing for each child under 18, not to exceed 66 $\frac{2}{3}$ per cent; to children under 18 left orphan, 25 per cent for one child, and 10 per cent additional for each additional child not to exceed a total of 66 $\frac{2}{3}$ per cent, to be shared equally; to wholly dependent parents, compensation of 25 per cent for one or 20 per cent

each for both. The bill also specified in detail compensation for collateral relatives. In computing compensations, no monthly pay could be considered above \$100 nor below \$50. Burial expenses not to exceed \$100 were allowable at the discretion of the Commission. Moreover, small compensations of \$5 per month could be commuted by a lump sum payment. Injured employees were required to give notice of injury within 48 hours; and all claims must be filed within 60 days after injury. Several sections of the bill required medical examination of those seeking employment, and provided for medical examination as to injury and occupational diseases. Section 31 of the bill created a Commission of three, to be appointed by the president at salaries of \$5000 per year, and to be known as the United States Employees' Compensation Commission.

SAFETY FIRST. The great wave of workmen's compensation legislation stimulated a movement among both employers and employees to introduce safety devices into mills and factories, and by every possible means to prevent the occurrence of preventable accidents. It was estimated by experts that about one-third of preventable accidents could be eliminated by the mechanical guarding of machinery. A portion of the remaining two-thirds were believed an irreducible minimum but a large proportion were believed capable of elimination by safety organization. Illustrative of methods are those practiced by the United States Steel Corporation, and similar concerns. In 10 years that corporation reduced the number of accidents about one-half. The Illinois Steel Company provided a safety inspector in each plant; organized committees of three workmen in each of the various divisions of each plant, each workman serving thereon in rotation; printed safety rules in several languages; erected illuminated safety signs at gateways, along roadways, and elsewhere; posted safety bulletins at every entrance; and distributed safety tokens to workers in departments having best records. In five plants the number of accidents was reduced by two-thirds in 10 years. Other concerns showed a reduction of from 50 to 65 per cent in the number of accidents. In Wisconsin excellent results followed the coöperation of manufacturers with the Industrial Commission. Similar coöperation has followed in California, Ohio, New York, and Pennsylvania.

The NATIONAL COUNCIL FOR INDUSTRIAL SAFETY held its third annual meeting at Chicago about November 1. It was composed of manufacturers, railroad officers, and business managers employing nearly 1,000,000 workers. Nearly every large railroad and industrial establishment in the country was represented, and smaller organizations have joined the Council by the hundred. The Secretary, W. H. Cameron, declared that the industrial accidents of six years ago, which amounted to 25,000 deaths and 2,000,000 injuries, had been reduced one-half, largely as the result of the activities of the Council. Ida M. Tarbell and others emphasized the very great importance of publicity in the "Safety First" campaign. Great interest was manifested in the subject of disease prevention, which was a new topic for the Council. Dr. K. W. Schereschewsky presented a paper on the physical examination of 3100 men and women workers in the clothing industry in New

York. Dr. George M. Price, Director of the Joint Board of Sanitary Control in the cloak, suit, and skirt industry of New York, described the health measures taken in that industry, and pointed out that the day of self-regulation in industry had passed. Dr. Theodore B. Sachs described the efforts of the Chicago Tuberculosis Institute to induce employers to introduce systematic physical examination of workers and applicants for work. Considerable discussion was devoted to consideration of hospitals for disabled workmen; the pension system for the incurable; the care of worn-out workers; and the need of social insurance for sickness, old age, and invalidity. This latter was determined upon as the subject for 1915.

WORKMEN'S INSURANCE. See OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; and WORKMEN'S COMPENSATION.

WORLD PEACE FOUNDATION. See INTERNATIONAL ARBITRATION AND PEACE.

WRESTLING. The winners of the United States National Championships held under the auspices of the Amateur Athletic Union were: 108-pound, Richard Goudie, Lima, Ohio, Y. M. C. A.; 115-pound, John Varres, Hull House; 125-pound, S. Vorres, Hull House; 135-pound, H. H. Jenkins, Pittsburgh A. A.; 145-pound, H. H. Jenkins; 158-pound, Ben Reuben, Hebrew Institute; 175-pound, E. C. Caddock, Hebrew Institute; heavyweight, Arnold Minkley, Banker's.

Cornell for the second successive year won the intercollegiate title with Pennsylvania second, and Lehigh third. The winners of the main bouts were: 115-pound, Culberson, Cornell; 125-pound, Boak, Cornell; 145-pound, Allen, Cornell; 175-pound, Pendleton, Columbia; heavyweight, Dorizas, Pennsylvania. The University of Indiana won the Western Intercollegiate championship.

In professional circles Stanislaus Zybaszko again reigned supreme, his principal victories being over Americus, Dr. B. F. Roller, and Raymond Cazeaux.

WRIGHT, MARIE (ROBINSON). An American author, died Feb. 1, 1914. She was born in Newnan, Ga., and was educated privately. After the death of her husband, Hinton P. Wright, she traveled and engaged in literary work. In 1889 she was commissioner from Georgia to the Paris Exposition. She made a special study of Spanish America, and took many long journeys in Mexico, Bolivia, and other Latin American countries, in 1904 making a record trip over the Andes. She was special delegate of the Geographical Society of Brazil in the Centennial Celebration of Mexico in 1910. Among her writings are: *Picturesque Mexico* (1897); *The New Brazil* (1901; revised edition, 1907); *The Republic of Chile* (1904); *Bolivia* (1907); *The Old and New Peru* (1909). She was a member of several American and foreign geographic societies.

WYOMING. POPULATION. The estimated population on July 1, 1914, was 168,736. The population in 1910, was 145,965.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. bu.	Value
Corn	1914	21,000	525,000	\$368,000
	1913	17,000	498,000	894,000
Wheat	1914	100,000	2,290,000	2,088,000
	1913	90,000	2,250,000	1,620,000
Oats	1914	225,000	7,875,000	8,780,000
	1913	320,000	8,860,000	3,344,000
Barley	1914	16,000	528,000	838,000
	1913	13,000	396,000	242,000
Potatoes	1914	15,000	1,620,000	1,134,000
	1913	12,000	1,680,000	1,092,000
Hay	1914	500,000	1,150,000	8,625,000
	1913	480,000	912,000	6,110,000

a Tons.

MINERAL PRODUCTION. The output of the mines of the State in 1913, was estimated as follows: gold, \$26,100; silver, 1040 ounces; copper, 437,000 pounds; compared with \$22,235 for gold, 265 ounces of silver, and 25,080 pounds of copper in 1912. The estimates of the United States Geological Survey for 1914 indicate a small decrease in the metal production over the production of 1913. The production of coal in 1913 was 7,393,066 short tons, with a value of \$11,510,045, showing an increase of 24,942 short tons in quantity, but a decrease of \$138,043 in value. The troubles between operators and the miners' union in Colorado benefited Wyoming by an influx of labor from the Colorado fields, and increased the demand for domestic coal from Kansas, Nebraska, and northern Colorado. The production of coal in 1914 is estimated to have decreased about 7 per cent. The number of men employed in the coal mines of the State in 1913 was 8331. The total value of the mineral products of the State increased from \$13,374,088 in 1912, to \$13,682,091 in 1913.

TRANSPORTATION. The railway mileage in the State on Jan. 1, 1913, was about 2000.

The principal material development in Wyoming in 1914 was the completing of the Chicago, Burlington, and Quincy Railroad through central Wyoming, thus putting the State upon the through line of that railroad from Puget Sound to Galveston.

FINANCE. The report of the State Treasurer for the biennial period 1912-14 shows a cash balance on Oct. 1, 1912, of \$630,235. The receipts for the period amounted to \$2,636,068, and the disbursements to \$2,322,814, leaving the cash on hand on Sept. 30, 1914, \$718,426. The bonded debt of the State on Sept. 30, 1914, amounted to \$111,000, of which \$90,000 was public building bonds.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State Board of Charities and Reform, include the State Hospital for the Insane, at Evanston; Wyoming State Penitentiary, at Rawlins; Wyoming Soldiers' and Sailor's Home, at Buffalo; Big Horn Hot Springs Reserve, at Thermopolis; Wyoming General Hospital, at Rock Springs; Wyoming General Hospital, at Sheridan; Wyoming General Hospital, at Casper; and Wyoming School for Defectives, at Lander.

EDUCATION. The total number of school children between the ages of 6 and 21 at the end of the school year 1913-14 was 35,550, of whom 32,677 were native born. The total enrollment of white pupils was 27,412, and of colored pupils 124. There were, in the State, 684 graded, and 32 high schools, and during the year 71 schoolhouses were built. The estimated value of school buildings was \$1,512,510. There were employed in the schools 1366 teachers, of whom

1195 were females, and 171 were males, the average monthly salary of male teachers being \$81.11, and of female teachers \$57.86. The total disbursements for the support of schools amounted to \$1,358,234, of which \$638,828 was paid to teachers.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in 1914, as the sessions are biennial and the last was held in 1913. Elections were held in 1914 for Governor and for representative-at-large. The Democrats nominated John B. Kendrick for Governor, and in the election of November 3 he was elected, receiving 22,387 votes, compared with 19,174 for Ridgeley, Republican, 1816 for Paulson, Socialist. Mr. Kendrick received the support of the Progressive party in the State. The total vote cast was 43,377, compared with 42,296 in 1912. It is not possible to compare the figures as the Prohibition and Democratic parties combined in the election of 1914. The Republicans elected a representative-at-large, and a majority in both houses of the Legislature.

PRESENT STATE GOVERNMENT. Governor, Jos. M. Carey; Secretary of State, F. L. Houx; Treasurer, J. L. Baird; Auditor and Commissioner of Insurance, R. B. Forsyth; Adjutant-General, V. K. Hart; Attorney-General, Douglas A. Preston; Superintendent of Public Instruction, Rose Baird Maley—Houx, Baird, and Preston, Democrats; Carey, Progressive; rest Republicans.

JUDICIARY. Supreme Court: Chief Justice, R. H. Scott; Associate Justices, Cyrus Beard, Chas. N. Potter; Clerk, W. H. Kelly—all Republicans.

STATE LEGISLATURE, 1913.

	Senate	House	Joint Ballot
Republicans	15	81	46
Democrats	12	26	38
Republican majority	3	5	8

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WYOMING, UNIVERSITY OF. A State institution for higher education founded at Laramie, Wyoming, in 1886. The total enrollment in all departments of the university for the academic year 1914-15, up to Dec. 8, 1914, was 508. The faculty numbered 66, and there were no noteworthy changes in the faculty during the year. A \$1000 history scholarship in memory of Dr. Agnes M. Wergeland was the only notable benefaction. The new Agricultural Hall, costing, with equipment, over \$110,000, was finished and occupied at the beginning of the fall semester. The productive funds of the university amount to about \$60,000, and the income in 1913-14 to \$192,534.08. The library contains approximately 35,000 volumes. The president is Clyde Augustus Duniway, Ph.D., LL.D.

X-RAYS. See CHEMISTRY; and PHYSICS.

YACHTING AND MOTOR-BOATING.

The yachting world suffered a severe disappointment in 1914 through the calling off of the races for the America's Cup, as the result of the European War. Three defenders had been constructed in the United States, and preliminary races between them had been held when the blow fell. Sir Thomas Lipton's challenger, the *Shamrock IV*, in the meantime had crossed the Atlantic, having made the trip from England by way of Bermuda in 21 days, 23 hours.

The acceptance by the New York Yacht Club of the Lipton challenge was hailed with delight by yachtsmen, and was followed by the quick building of three sloops for the defense of the cup. These boats were the *Resolute*, designed and constructed by the Herreshoffs for a syndicate of officers and former officers of the New York Yacht Club; the *Vanitie*, designed by William Gardner, and built by Lawley and Son for Alexander Smith Cochran; and the *Defiance*, designed by George Owen, and built by the Bath (Me.) Iron Works for a syndicate of Philadelphia, Boston, and New York yachtsmen.

In the test races the *Resolute* made by far the best showing, but no decision as to which craft should have the honor of meeting the *Shamrock* had been reached when the race was cancelled. The *Resolute* won 13 of the preliminary clashes, and the *Vanitie* 6. The *Defiance* started in 11 races. She was third in 8, second in 1, disabled in 1, and failed to finish in 1. The *Shamrock* was housed in South Brooklyn, while the *Resolute* and *Vanitie* were hauled out at City Island.

The cruise of the New York Yacht Club was fairly successful, despite its curtailment because of the war. Twenty-eight yachts took part in the first squadron run from Glen Cove to Smithtown Bay, 30 in the second run to New London, and 28 in the third run from New London to Newport. The races for the cups offered by Commodore Pratt and Vice-Commodore Baker were not held on account of the war. The King's Cup Contest also was abandoned.

MOTOR-BOATING. The motor-boat season proved interesting to followers of the sport, although the war put an end to the preparations for the international race for the Harmeworth Trophy. *Baby Speed Demon II*, owned by Mrs. Paula H. Blackton, the only woman member of the Motor Boat Club of America, was the most notable performer of the year. This high speed boat won the Blackton Cup at the club meet in Buffalo, traveling at the rate of 47.50 miles per hour for the 35-mile course. The same craft also captured the Conners Cup and the Gold Challenge Cup at the Lake George regatta. *Baby Reliance V*, owned by J. Stuart Blackton, won the Chamber of Commerce Cup, her speed being 38.03 miles per hour.

YALE UNIVERSITY. The total enrollment in all departments of the university in 1914, was 3289, divided as follows: Graduate School, 371; College, 1437; Sheffield Scientific School, 1056; School of the Fine Arts, 38; School of Music, 82; School of Forestry, 37; School of Religion, 112; School of Medicine, 50; School of Law, 142. The faculty numbers about 460. There were two additions made during the year: Wesley Newcomb Hohfeld, formerly professor of law at Leland Stanford Jr. University, was appointed professor of law; and Arthur Kenyon Rogers, formerly professor of philosophy at the University of Missouri, was appointed professor of philosophy. The productive funds of the university amounted, at the end of the year 1914, to \$15,379,363. The income in the same year amounted to \$809,071. The library contains about 1,000,000 volumes. (For a summary of the gifts received during the year see GIFTS AND BEQUESTS, and for further notes in regard to the university in general see UNIVERSITIES AND COLLEGES.) The president is Arthur T. Hadley.

YELLOW FEVER. See **TROPICAL DISEASES; VITAL STATISTICS.**

Y. M. C. A. See **YOUNG MEN'S CHRISTIAN ASSOCIATIONS.**

YOUNG, JAMES SCOTT. An American jurist, died Feb. 25, 1914. He was born in Pittsburgh in 1848 and graduated from Washington and Jefferson College in 1869. The next three years he read law in Pittsburgh and in 1872 was admitted to the bar. He practiced in Pittsburgh until 1902, when he was appointed United States Attorney for the western district of Philadelphia, serving until 1905. In that year he became judge of the Court of Common Pleas of Allegheny Co., and after serving on this bench for three years he was appointed United States district judge for western Pennsylvania, in which capacity he served until his death.

YOUNG, SUPERINTENDENT ELLA FLAGG. See **FEMINISM.**

YOUNG MEN'S CHRISTIAN ASSOCIATIONS, INTERNATIONAL COMMITTEE OF. The International Committee in 1914 consisted of 72 regular members, 19 advisory members, and a Board of Trustees of 14 members. It is the direct agent of the associations of North America, and is elected by delegates from these associations meeting in triennial convention. Its work is carried on in North America, Latin America, Asia, Africa, the Levant, and the eastern part of Europe. In the home field, the committee maintains a force of 109 executive, traveling, and office secretaries, and in the promotion of association work in foreign lands, it maintains a staff of 173 secretaries. There were, in 1914, 2821 associations in North America, classified as follows: City and Canal Zone, 671; County and Town, 773; Railroad, 250; Student, 668; Colored, 145; Indian, 78; A. & N., 36. These associations had an aggregate membership of 625,698, and the net value of their property was over \$88,000,000. Libraries are maintained by 497 associations, and 788 occupy buildings of their own. There are 84,577 students in educational classes, 138,500 students in Bible classes, and 331,500 young men in the gymnasias. The Publication Department of the Committee is carried on under the name "Association Press," which issued in 1914 38 new publications. The Press also issues *Association Men*, a monthly magazine, and several other periodicals. The Committee expended for its home work in 1914, \$385,050, and in its foreign work \$437,278. The chairman of the Committee in 1914 was Alfred E. Marling; general secretary, Richard C. Morse; general secretary for foreign work, Dr. John R. Mott; executive secretary, Frederic B. Shipp.

YOUNG WOMEN'S CHRISTIAN ASSOCIATIONS, NATIONAL BOARD OF. The object of this board is to unite in one body the Young Women's Christian Associations of the United States; to establish and develop such associations; to advance the physical, social, intellectual, moral, and spiritual interests of young women; and to participate in the work of the World's Y. W. C. A. The total number of city and town associations under the supervision of the board in 1914 was 239, with 258,644 members, and 1604 employed officers. The associations having educational work numbered 201, those having organized religious departments, 185, those with physical departments 191, and those having employment work 124. The total

number of buildings owned in 1914 was 215, the value of real estate was \$14,416,070. The total budget for the year was \$4,623,432. As a result of the campaigns carried on in 1914, building campaign pledges to the value of \$4,145,000 were obtained. In addition to city and town associations, there were, in 1914, 11 county associations with 3805 members, and 702 student associations, with 62,533 members. Miss Grace H. Dodge, president of the board, died in 1914. The secretary is Mrs. William Rossiter, and the treasurer, Mrs. Samuel J. Broadwell. The general secretary is Miss Mabel Cratty.

YSER, BATTLE OF. See **WAR OF THE NATIONS.**

YUAN SHI-KAI. See **CHINA, History.**

YUKON. A territory of the Dominion of Canada. Area, 207,076 square miles; population (1911), 8512. Capital, Dawson, with (1911) 3013 inhabitants. The territory is administered by a commissioner, George Black in 1914. See **CANADA.**

YUKONITE. See **MINERALOGY.**

ZABERN INCIDENT. See **GERMANY, History.**

ZANZIBAR. An island (640 square miles—the largest coralline island on the African coast) which, with Pemba (380 square miles) and several other small islands, constitutes a British protectorate. Population, 197,199 (Europeans about 250), including about 10,000 Arabs, and about 20,000 Indians. The port of Zanzibar is a centre of trade with India, Arabia, and the mainland. It has an excellent water supply, the works being completed July, 1913. Tropical products are exported. Total imports and exports 1912, £1,030,996 and £1,036,127 respectively. Revenue 1912, £242,483; expenditure £334,679; debt, £68,861. The protectorate was transferred July 1, 1913, from the control of the Foreign Office to that of the Colonial Office. The reigning Sultan is Seyyid Khalifa bin Harub. J. H. Sinclair was acting British agent and consul-general in 1914.

ZEPPELIN AIRSHIP. See **AERONAUTICS, and WAR OF THE NATIONS.**

ZINC. The production of primary spelter from domestic ores in 1913 was 337,252 short tons, valued at \$37,772,224, compared with 323,907 tons, valued at \$44,688,166 in 1912. The total production of spelter from both domestic and foreign ores in 1913 was the greatest in the history of the zinc smelting industry, being 346,676 short tons, as against 338,806 tons in 1912. Along with this increase in production there was a large decrease in the apparent consumption, which was 45,002 tons less than that of 1912.

Missouri leads all other States in production of crude zinc ore, the production in 1913 being 8,049,300 short tons. Wisconsin was second, with 1,406,000 tons; Kansas third, with 590,300; Oklahoma fourth, with 581,100; New Jersey fifth, with 490,434. For further details in regard to production of individual States, see the mineral articles in these States. See **METALLURGY.**

ZOOLOGY. As has been stated in earlier **YEAR BOOKS**, research in zoölogy is at the present time being conducted along a number of highly specialized lines, much of this work being too technical to allow of general summary, and some (as, for example, heredity) is developing new points of view so rapidly that final conclusions are not yet reached, so that whatever

reports are made must be regarded as having only a tentative value. Other lines of experimental zoology are attracting much attention, and the newer science of oecology, has, in the United States, received some impetus from workers at the University of Chicago. The European War cut off a large number of periodicals, and undoubtedly many researches were for that reason not brought to the attention of zoologists. In the following paragraphs important announcements of advances in general zoology will be taken up first, and followed by some more general reports.

PROTOZOA. Woodruff and Baitsell decided that protozoa may be kept for an indefinite period without conjugation if a proper environment is furnished. (See below.) Lund, working on *Bursaria*, and Metalnikov, on *Paramacium*, decided that the animals are able to discriminate between nutritious, on the one hand, and nonnutritious or toxic, materials on the other. *Bursaria* will throw off vacuoles containing indigestible substances, while retaining those with digestible materials, and *Paramacium* after having once taken toxic or nonnutritious substances, will not take in these same substances, though it will take in others. Metalnikov considers this a true process of learning.

PORIFERA. Parker found that a "finger" of a Bermuda sponge 10 c.m. long and 4 c.m. in diameter, would discharge about 78 liters of water in a day. He did not attempt to determine the character of the organisms brought into the animal by this current. The highest pressure obtained in any current flowing through the oscula of these sponges was 2.5 m.m.

ANNELIDS. Baylis described a new genus and species of Oligochaeta (*Aspidodrilus kelsalli*) living on the surface of an undescribed earthworm. He concluded that it was probably commensal rather than parasitic, since its alimentary canal contained vegetable debris. Korschelt reported on the length of life of earthworms. The longest life recorded among his specimens was a *Helodrilus longus* which lived for over 10 years. *Lumbricus terrestris* lived six years, and *Eisenia fetida* about four and one-half years. It should be noted that these are observations on animals in confinement, and their life is possibly longer than in their natural environment, where enemies abound. Korschelt observed that, on the approach of cold weather, these earthworms burrow to below frost level, and roll up in a ball at the bottom of their tube, passing into a regular hibernating condition.

MOLLUSCA. Kuhn, working on the biology of the snail, *Helix pomatia*, found that the animal may enter into the hibernating condition at any time of the year; in the winter as a reaction to temperature (though here also a seasonal rhythm can be shown), at other seasons as a protection against drying. The animal draws into the shell and secretes an operculum over the opening, but the chalk deposit in this operculum appears only at the approach of winter. If the operculum is in good condition, the animals will resist very unfavorable conditions, and those who die do so because of some defect in the operculum. Experiments showed that respiration takes place through both the operculum and the shell. A decrease in the water content of the liver and muscles, and a deposit

of lecithin in the liver, and of glucose in the liver, foot muscle, and albumen gland, marks the progress of the hibernation. Moisture is of the utmost importance to the animal, for it moves only in a moist atmosphere and reacts to food only if the latter be damp. According to Flossner, the difference between a simple diaphragm and the heavy operculum of the winter hibernation of the snail is merely that the latter has more calcium carbonate. Thus operculum formation is largely a matter of crystallization of calcium carbonate.

Orton had earlier found that the food of *Crepidula* is similar to that of the oyster, and the question arose as to the function of the radula. He later found that the fine particles of the food are drawn in by the gill currents, combined with mucus and passed forward to the head. The radula bites off bits of this mass, and passes them into the mouth. Further study led him to the conclusion that the gills of lamellibranchs have essentially this same function to collect and combine food with mucus, and that they are only partly for respiration, this latter function being restricted to what he called the branchial extensions of the gills.

Among the collections of the Michael Sars Expedition were a number of cephalopods, on which reports were made during 1914. Of interest was the collection of several early stages of *Spirula*, taken in the plankton near the Canary Islands. The youngest stages were 6 to 9 m.m. long, and a number of older specimens were found. A new cephalopod, *Cirrothauma murrayi*, was remarkable for the gelatinous semitransparent character of the body.

ARTHROPODA. D. C. Worcester described a flying crustacean 15 to 25 c.m. long, which occurs off the coast of Palawan in the Philippine Islands. The animal can rise above the surface of the water and fly in the same manner as the flying fish.

The largest lobster on record was sent to the American Museum of Natural History in September of 1913. It was 38 inches long, and weighed 21 pounds.

While the beaver parasite *Platypylla castoris* is the classic example of a parasitic beetle, Kellogg described other cases where this habit seems to be forming. *Leptumus testaceus* occurs in both Europe and America in nests of field mice and shrews, and shows beginnings of characteristic changes due to a parasitic life. *Lyrosoma opacum* is found on isolated rocks in the North Pacific, and is apparently carried from rock to rock by birds. This seemed to Kellogg to be but a step from true parasitism, as the change from feeding on feathers in the nest to feeding on the bodies of the living birds would be very easy to take.

McIndoo studied the olfactory reactions of the honey bees and concluded that the olfactory organs are pores found on the bases of the wings and on the legs, the antennae having no function in this connection. In the bee, he found a scent producing organ situated between the fifth and sixth abdominal somites. This secretes a volatile substance which is held in and evaporates very slowly when the abdomen is straight, but evaporates and thus diffuses rapidly through the air when it is flexed.

VERTEBRATES. While there is still disagreement as to the mechanism of the flight of fishes,

Ridewood claimed to have discovered that a South American fresh water flying fish, *Gastropileous*, flaps its fins when it "flies," while the ordinary flying fish, *Eucetus*, merely glides. Mayhoff studied the mechanism of the migration of the eyes in flatfish, and decided that muscular action is not involved, but that migration is due to the cooperation of several factors, chiefly movements of the head skeleton.

Laurens stated that frog tadpoles show no response to light but that *Amblystoma* larvæ are positively phototactic even if deprived of eyes. In the latter case, he thought that nerve endings in the skin were able to receive light stimulations. Somewhat similar results were obtained by Ackert, who studied the nerve endings in the skin of the bat, and, from their distribution and the review of the literature, concluded that a blinded bat is able to discover when it is approaching an object, by the effect of the condensation of the air against the skin, thus stimulating the nerve endings. In the amphibian *Necturus*, Eyclesheimer found that the reactions to light were essentially the same if the head were cut off as in the intact animal. This is due to a "dermatopteric" sense.

Marie Phisalix concludes from a study of the poison apparatus of snakes, that these are a direct development of the use formerly made of these organs in digestion. They originally were simply paralyzing organs and facilitated swallowing by keeping the prey quiet. Their poisonous character is simply an exaggeration of their primitive function.

Sex. While the question of the meaning of sex is still entirely unsolved, zoologists in general believe that light may be thrown on it by a study of the conjugation processes in the Protozoa. *Paramœcium* is the form most frequently studied, and here conjugation is essentially a transfer of nuclear matter from each one of a pair of individuals to the other. This was interpreted to mean that this transfer is in some fashion a process of rejuvenation, each giving to the other something which it lacks but which is essential for its continued existence. Weismann, on the other hand, argued that it is not a rejuvenation process, but a method of producing variability in the race by varying its nuclear composition. Later workers reached conflicting results (consult NEW INTERNATIONAL YEAR BOOK for 1913), a condition which Calkins decided was due to the fact that different workers used different races, his conclusion being that in *Paramœcium* there is a definite life cycle, and that death will sooner or later occur unless conjugation takes place.

Woodruff, on the other hand, has been able to keep *Paramœcium* for more than 4500 generations without any conjugation, though individuals taken from these cultures and given an opportunity to conjugate will do so, thus showing that they are not without the ability. During this time there appeared marked periodic variations in the division rate, and Woodruff and Erdmann published, at some length, the results of a study of the nuclear changes accompanying the rhythms. From October, 1913, to April, 1914, specimens were taken daily, stained, and mounted to show the nuclear conditions. In general, nuclear changes occurred which were very similar to those which accompany normal conjugation. The macronucleus breaks up and eventually disappears, as it does during conjugation,

though there are some morphological differences between the two cases. The micronuclei divide as in conjugation, though possibly the last division leading to the "migratory" nucleus does not take place. After the macronucleus disappears, either the cell divides, or a reorganization takes place without this division. In either case the new nuclear equipment comes from a division of the micronuclear matter left in the cell. The authors' conclusion was that the *Paramœcium*, if not allowed to conjugate, periodically reorganizes itself by a process which is similar to conjugation, but without any transfer of nuclear matter. This they called "endomixis." This endomixis fills the same place in the life of the animal that conjugation does, and is sufficient to prevent senile degeneration. This might be called a process of parthenogenesis, but the authors thought that the nuclear conditions were different from those of true parthenogenesis.

These results were discussed by Hertwig, who compared them with results which he obtained on this same species 25 years earlier. These had been obtained only in *Paramœcium aurelia*, which has two micronuclei, and those with only one micronucleus, so far as has been discovered, do not show them. Hertwig suggested that there was possibly a fertilization of one micronucleus by another, thus a true process of autogamy. Hertwig's general conclusion was that these experiments do not demonstrate that protozoa are "potentially immortal," but instead indicate that the body of each, like the body of the metazoa, contains in itself a mechanism of reorganization; while a part of the body dies, a portion of it is rebuilt into a new individual.

In the rotifer *Hydatina senta*, Whitney claimed that he had been able to control sex by varying the food of the animals. A strain was used in which the percentage of males was very low, and this continued so long as the animals were fed on a flagellate, *Polytoma*. When a sudden change was made to another protozoon, *Dunaliella*, the grandchildren of those first treated showed a marked percentage of males, hence the conclusion that the food had determined the sex. Cases have been described where a change of temperature was followed by similar results. Whitney thought that these were really due to changes of the diet, for the rotifers were fed on mixed cultures of protozoa, and the variations in temperature by favoring one form rather than another, resulted really in a change of food. Hence it was the food rather than the temperature which was the active agent.

Geoffrey Smith, who for some years has been attempting an analysis of sex by observations on the crabs infested by *Sacculina*, where a deterioration of sex organs follows parasitism, has, in collaboration with Hamm, continued this study on *Stylops*, a parasitic insect infesting the bee. Here they found that the ovary will disappear as a result of parasitism, but no loss of external sex characters follows this degeneration. In the male, no effects were noticed.

In the NEW INTERNATIONAL YEAR BOOK for 1913, mention was made of experiments conducted by F. R. Lillie, who found in an annelid, *Nereis*, and a sea urchin, *Arbacia*, a substance secreted by the egg which first acts as an agglutinator of the spermatozoa and subsequently

activates it so as to produce fertilization. Lillie, in 1914, continued his work on this substance in the egg of *Arbacia*. The mechanism by which this substance (to which he now gives the name "fertilizin") operates, can best be described by using the terminology of immunology, though Lillie insisted that this terminology is employed only for convenience, and the analogy must not be pushed too far. Bearing this caution in mind, we may then regard fertilizin as a receptor, with a spermophile and an ovophile combining group. When its spermophile group combines with the spermatozoon, the ovophile group is activated and by combining with the egg, causes fertilization. The egg is thus fundamentally self-fertilizing, a conclusion which has important bearing on the "amazing number" of agents that initiate artificial parthenogenesis. Contact of the spermatozoon with the egg is necessary in order that this process should start, and as soon as this occurs, another substance, "anti fertilizin," neutralizes the fertilizin, thus preventing the entrance of a second spermatozoon. Lillie compared this with the lysin theory of Loeb, and concluded that the evidence is in favor of the belief that the egg rather than the spermatozoon contains the fertilizing substance.

Loeb, in rejoinder to this theory of Lillie's, described results obtained from a study of a California sea urchin, *Strongylocentrotus purpuratus*. Here he found also a substance which causes clumping of the spermatozoa which he thought identical with that described by Lillie, but which was not, in his opinion, a true agglutinator, for it does not work on spermatozoa deprived of their motility, while true agglutination would occur irrespective of any activity of the spermatozoa. He regarded the clumping as possibly a trophic reaction. Loeb also pointed out that if this is essential for fertilization, it ought to appear whenever true fertilization occurs. As a matter of fact, it appears only when eggs and sperm of the same species are mixed, and does not appear in cases of hybridization, even though there may be perfect fertilization.

MUTATION. Jeffrey corroborated Davis (consult NEW INTERNATIONAL YEAR BOOK for 1912) in claiming that the so called mutations of *Oenothera* are hybrids breaking up into their component species. De Vries replied to this by saying that the mutation theory is not dependent on *Oenothera* alone, but is based on results of other experiments. As far as *Oenothera* is concerned, he claimed that the variability is greater than could be explained on any assumption of its hybrid condition.

EVOLUTION. Decidedly revolutionary theories were proposed by Bateson in addresses prepared for delivery as President of the British Association for the Advancement of Science. Basing his belief on the results of his own experiments on plants, where he found that the appearance of a supposedly new character is always due to the removal of a previously inhibitory factor, Bateson stated his belief that what are apparently new characters in evolution, are always previously existing ones which have earlier been masked and not allowed expression. The only causes of variation are removal of an inhibitor; loss of a factor; quantitative change in a factor; and crossing. Therefore we have no reason to think of evolution as a progression from

simple to complex, but the reverse. Bateson says: "I have confidence that the artistic gifts of mankind will prove to be due not to something added to the makeup of an ordinary man, but to the absence of factors which, in the normal person, inhibit the development of these gifts." So far as is known to the reviewer, criticism of Bateson's position has been universally adverse.

HEREDITY. The late Professor Whitman of the University of Chicago, left, at his death, a large collection of pigeons on which experiments on heredity had been conducted for some years. These birds have been taken to the Station for Experimental Evolution at Cold Spring Harbor, where Professor Whitman's work is being continued by Dr. Riddle, under the auspices of the Carnegie Institution of Washington. In Germany, the first establishment of its kind in the country, an Institut für Vererbungsforschung was announced for the summer session of the Royal Agricultural High School in Berlin.

At the Maine Agricultural Experiment Station, Pearl and his colleagues continued work on genetics chiefly on problems connected with the domestic fowl. Much of Pearl's publications dealt with very technical phases of genetics, but in the annual report of the Station for 1914, he summarizes in simple form the most important of these results for the use of poultry breeders.

Morgan and his students continued investigations on the fruit fly (consult NEW INTERNATIONAL YEAR BOOK for 1913), with the results that further factors, especially of the "sex linked" kind, were isolated. Morgan also finds in the fruit fly a number of "lethal factors" which act so as to produce the death of the individual possessing them.

Morgan summarized the most important recent work on heredity, together with his conclusions on the question of chromosomes and sex determination, in a book, *Heredity and Sex*, which appeared at the end of 1913.

Since Morgan's flies had all been etherized, the suspicion might arise that the mutations reported in his experiments were in direct response to the ether stimulus and therefore not normal mutants. Experiments devised to test the probability of this kind of stimulus resulting in mutation, gave no reason to suppose that it had taken place.

Castle's earlier work had seemed to show that in breeding rabbits, the ear length of the offspring was a blend of that of the parents, thus seeming to be in opposition to strict Mendelian laws. East explained this result by the assumption of "multiple factors" for ear length, the latter varying with the number of factors that are present. MacDougall claimed that if multiple factors are present, back crossing ought to give greater variations than appeared before. The results of his experiments on rabbits seemed to show a greater variability under these conditions, and thus to confirm his theory.

According to the "pure line" hypothesis of Johanssen, selection can act only so as to isolate races already in existence, and can never produce anything new. East and Hays in tobacco, and Ewing in the inheritance of antennal length of plant lice, found confirmations of this view, while Castle, on the other hand, reported evidence that selection did result in a definite increase or decrease beyond anything previously

present. Apparently the pure line question is as yet unsettled.

A commonly accepted belief among animal breeders, though largely abandoned by horse, cattle, and swine breeders, is the idea that if a female is first mated with a low bred male, her later offspring will be affected by the union, even though pure blood males may be employed for the later union. This is known as "telegony," and is not generally accepted by students of heredity, experiments made some years ago on breeding horses and zebras resulting in negative evidence. The subject was discussed again by Rabaud, who went over all the available evidence, and concluded that there is nothing to be said in its favor. There might possibly be some interchange of material between the blood of the fetus and that of the mother, so that after one impregnation she would be different from what she was before, but this would be too indefinite to be of any importance in a discussion of heredity.

Newman studied the mode of inheritance in various teleost hybrids, and concluded that while the spermatozoon initiates the development, it takes no active part in the formation of the embryo until, at least, the beginning of gastrulation. At this time it begins to play a part in the formation of the embryo, and if it fails to cooperate with the egg components, the embryo does not develop normally. He was unable to get any decisive results bearing on the question of Mendelian inheritance in these hybrids.

Jordan discussed the available data on left-handedness in man, and concluded that this acts as a Mendelian recessive, though occasionally modifications of this rule appear.

CHROMOSOMES. The possible rôle of the chromosomes as carriers of hereditary qualities, continued as a subject for discussion during the year, and probably the majority of workers took the position both that the chromosomes are carriers of hereditary qualities, and that the accessory chromosome in some way determines sex. Muller, for example, thought that the discovery of a new, bent-winged, mutant in the fruit fly gave him data for a final analysis of the function of the separate chromosomes in this animal. There are first a pair of sex chromosomes, X and Y, and with the former are linked over 30 genes, the Y apparently having no function. Two pairs of "autosomes" (chromosomes other than sex chromosomes) are correlated with two other groups of genes with about 20 in each group, and a pair of smaller autosomes whose function has been in doubt, but Muller thinks they are associated with the newly discovered wing mutation. Since the chromosomes of this third group are small, the genes are closer together and of smaller size, and thus they do not mutate so often as in the larger chromosomes.

Wodsadelek reported the discovery of an accessory chromosome in the horse, though he had no information as to its relation to sex determination. Jordan reported that this accessory occurs in some mammals and not in others, and that no definite relation exists between the classification of these forms, and the presence or absence of the chromosome. The theory that this determines sex can hold in mammals only if we assume that the accessory occurs in the female in some species and the male in others.

A study of the ovogenesis would be necessary in order to determine this point. Guyer thought that an X or accessory chromosome is found in the male of the Black Langshan breed of fowl, thus making the fowl heterozygous for sex. The results of breeding of this fowl, however, indicate that the female is thus heterozygous, and Pearl and Boring reinvestigated the spermatogenesis of the animal with the result that they were unable to find any indication of the accessory chromosome, though there were many chromosomes which might be thus interpreted. Their decision was, therefore, that Guyer's interpretation was incorrect. Metz showed that the comparative chromosomal condition in several species of the fruit fly might indicate a definite progress, but he was unable to correlate this with any constant gradation of structures among bodily characters. Doncas reviewed the relation of chromosomes to inheritance of Mendelian characters, and concluded that the arguments connecting chromosomes with Mendelian segregation are strong, but not indisputable. The arguments connecting chromosomes with sex are stronger. He considered that sex is not determined by the presence or absence of a sex factor, but by a type of metabolism induced by the presence or absence of certain chromosomes.

On the other hand, Foot and Strobell, reporting on the heredity of the intromittent organ in insects, decide that something outside the chromosome is responsible for the transmission of the characters in the observed fashion.

Boveri suggested that malignant tumors are due to the aberrant action of the chromosomes in the cells, experiments on echinoderm eggs indicating that abnormal chromosomes are followed by abnormalities in the body.

PROTECTIVE COLORATION. J. C. F. Fryer studied the polymorphism of *Papilio polytes* by pedigree breeding, and while he came to no very clean cut conclusions, he was inclined to the belief that the mimicry displayed by the female is of very little use to the animal in its native habitat of Ceylon. Abbott studied the question of mimicry in the genus *Limenitis* by statistical methods. *Limenitis archippus* is a mimic of *Anosia plexippus*, and Poulton supposed that when *Limenitis arthemis* occurred in the same locality with *Anosia plexippus*, there would be variants of the former in the direction of resemblance to the latter, and thus toward the formation of the *Limenitis archippus*. A statistical study of a number of the color markings of the insect gave no evidence that any such change as was postulated was taking place.

GERM CYCLE. Weismann's theory of heredity was largely based on the idea that a germ plasma is continuous from one generation to the next, and that this material in the egg is more or less isolated from body-forming material, and follows a definite path to the sex organs of the new individual. The subject has again been studied by Hegner, who gave a general review of the literature on Crustacea and Insects where this "Keimbahn" has been studied. In the egg of the insect *Copidosoma*, the entire chromosome content of an oöcyte nucleus forms the "Keimbahn" determinant, while another oöcyte fuses with this and forms the nucleus of the developing egg. Thus every fully formed egg of *Copidosoma* consists of two oöcytes which have fused. Hegner has summarized the work that

has been done on this and allied subjects in a book *The Germ Cell Cycle in Animals*.

MARINE BIOLOGICAL LABORATORY. Of especial interest to the development of the biological sciences in the United States, was the formal opening, on July 10, of the new building of the Marine Biological Laboratory at Woods Hole, Mass. This was the gift of Mr. Charles R. Crane of Chicago, President of the Board

of Trustees of the Laboratory, and makes it possible for research to be continued throughout the year. The older buildings will be kept for use during the summer. See CARNEGIE INSTITUTION; ENTOMOLOGY; FISH AND FISHERIES; ORNITHOLOGY.

ZULULAND. Administratively a part of Natal (q.v.).

MAY 24 1915
